1. Project Overview

The **DALSoft5410** is developing cloud-based hotel reservation system **Serverless B&B**. As a company who delivers serverless solutions, we are following **multi-cloud** deployment and **backend-as-a-service (BaaS)** approach to reduce the development efforts and operational cost of the application. This strategy was proposed to address the issue with a server-hosted solution, which is that we must manually manage and setup the backend service, which is impractical due to resource constraints. There will be two types of users who will be using the application, the guest users, and the authorized users. Authorized users will be able to access additional services, but guest users will only be able to access a restricted number of services. The customers will be able to sign up and sign in inside the application. Customers will be able to reserve hotel rooms and place food orders through the kitchen services. The invoice will be created by the hotel administration based on the length of stay and the amount of food consumed. The user will receive virtual support for tasks like basic site navigation and managing reservations and food orders. Customers can also choose to use an additional tour operator service, which allows them to request trips and has them advised depending on their stay frequency and activities. [1]

For our multi cloud deployment architecture, we will use **Amazon Web Services (AWS)** and **Google Cloud Platform (GCP)** as cloud providers. We have decided to develop our frontend using **React.js** framework for easing and reducing the development efforts and for the serverless backend, we will be using **Node.js** and **Python** for creating lambdas for different microservices. The development process will follow agile methodology for rapid delivery of application in incremental stages.

2. Technology Requirements

The below technologies and tools are used in the project

Table 1: Table displaying tools and technologies used in this project.

Technologies & Tools	
Tools	Visual Studio Code, PyCharm
Serverless Cloud Providers	AWS, GCP
Programming Language	Python3.9, NodeJS
Frontend Framework	ReactJS
GitLab	Version Control System

3. Project Implementation

We have used below AWS and GCP cloud services for each module [1].

Overview

1. User Management Module

Tasks	Cloud Service used for task
Registration	AWS Cognito

2. User Authentication Module

Tasks	Cloud Service used for task
ID-Password	AWS Cognito
Question-Answer	GCP Firestore and Cloud function
Caesar Cipher	GCP Cloud Function

3. Online Support Module

Tasks	Cloud Service used for task
Interactive AI Chat Bot	AWS Lex and AWS Lambda

4. Message Passing Module

Tasks	Cloud Service used for task
Message Passing through Pub/Sub	GCP Pub/Sub, Firebase Cloud Messaging

5. Machine Learning

Tasks	Cloud Service used for task
Tour recommendations	Google Cloud, Vertex AI, Auto-ML, (Tabuler data classification model)
Polarity Score from customer's feedback	Google Cloud, Vertex AI, Auto-ML, (Sentiment Analysis model)

6. Web Application Building and Hosting

Tasks	Cloud Service used for task
Application Hosting	AWS Amplify

7. Other Essential Module

Tasks	Cloud Service used for task
Report Generation	GCP Cloud Function
Testing	AWS Lambda
Visualization	GCP Data Studio

The detailed explanation of each module is as follows:

Module 1: User Management Module

The entry point to the Serverless B&B application are the registration steps. Users will be prompted to enter details such as first name, last name, email, and password using a registration form.

The screenshot shows a web browser window for the 'Serverless B&B' application. The URL in the address bar is 'main.d1gwqj7lhjz8oz9.amplifyapp.com/register'. The page title is 'Register to Create Account!'. At the top, there is a navigation bar with links for 'Rooms', 'Meals', 'Tours', 'Feedback', 'Visualizations', 'Register', and 'Login'. Below the navigation bar, there are four input fields labeled 'First Name', 'Last Name', 'Email ID', and 'Password'. A large black 'Register' button is positioned below these fields. At the bottom of the page, there is a footer with a logo, a 'Rooms' link, and a 'ServerlessB&B Bot' button with a dropdown arrow.

Figure 1: Registration Form.

User inputs will be validated for null values, invalid email format, email already exists or password length and special character requirements.

The screenshot shows a registration form titled "Register to Create Account!". It includes fields for First Name, Last Name, Email ID, and Password. Each field has a red validation message below it: "Please enter a first name.", "Please enter a last name.", "Please enter an email.", and "Please enter a password.". A "Register" button is at the bottom.

First Name
*Please enter a first name.

Last Name
*Please enter a last name.

Email ID
*Please enter an email.

Password
*Please enter a password.

Register

Figure 2: Null values validation in Registration form.

The screenshot shows a registration form titled "Register to Create Account!". It includes fields for First Name, Last Name, Email ID, and Password. The First Name, Last Name, and Email ID fields have been populated with "Pankti", "Vyas", and "pankti.vyas2000@gmail.com" respectively. The Password field contains four asterisks ("****"). A red validation message below the Password field states: "Please enter a valid password that is longer than 8 characters and contains special characters, numbers, uppercase and lowercase letters." A "Register" button is at the bottom.

First Name
Pankti

Last Name
Vyas

Email ID
pankti.vyas2000@gmail.com

Password

*Please enter a valid password that is longer than 8 characters and contains special characters, numbers, uppercase and lowercase letters.

Register

Figure 3: Password constraints validation in Registration form.

The screenshot shows a web browser displaying the registration page of the 'Serverless B&B' application. The URL in the address bar is `main.d1gwq7hjz8oz9.amplifyapp.com/register`. The page has a dark header with the logo 'Serverless B&B', navigation links for 'Rooms', 'Meals', 'Tours', 'Feedback', and 'Visualizations', and buttons for 'Register' and 'Login'. The main content area is titled 'Register to Create Account!'. It contains four input fields: 'First Name' (Pankti), 'Last Name' (Vyas), 'Email ID' (pankti.vyas2000@gmail.com), and 'Password' (*****). Below the email field, a red error message reads '*Please enter a unique email ID.' A 'Register' button is at the bottom. At the bottom of the page, there is a footer with a user icon, a 'Rooms' link, a 'ServerlessB&B Bot' button, and a dropdown menu.

Figure 4: Unique email validation in Registration form.

Once the inputs are validated and user clicks on the Register button, an OTP will be sent to the users' email address as well as a new user will be created in AWS Cognito userpool with 'unconfirmed' status. Once the user validates the received otp in the Serverless B&B application, the status of user in Cognito userpool changes to 'confirmed'.

The screenshot shows the same registration page as Figure 4, but with different input values. The 'Email ID' field now contains a valid email address: pankti.vyas21@gmail.com. All other fields ('First Name', 'Last Name', and 'Password') remain the same as in Figure 4. The rest of the page, including the header, footer, and validation message, is identical to Figure 4.

Figure 5: Registration form filled.

The screenshot shows the AWS Cognito console under the 'User pools' section. A user pool named 'us-east-1_tw6DyffS1' is selected. The 'Users' tab is active, displaying 12 users. One user, 'pankti.vyas21@gmail.com', is highlighted with a blue border. The 'Confirmation status' column for this user shows 'Unconfirmed'. Other users have 'Confirmed' status. The 'Status' column shows green checkmarks for all users.

User Name	Email Address	Email Verified	Confirmation Status	Status
2a67c052-f27f-487e-89da-e36e7655aca1	mg425404@dal.ca	Yes	Confirmed	Enabled
3ed42231-408b-4fa4-a007-96921583578d	pankti.vyas2000@gmail.com	No	Unconfirmed	Enabled
412797e3-ecf1-4f50-ac0e-20cef2a5497b	ridham3007@gmail.com	Yes	Confirmed	Enabled
728cf45-c85d-4034-9e4b-3f6a0294c04d	minalvyas119@gmail.com	Yes	Confirmed	Enabled
9480233a-a0bc-439b-8946-c6a3e8fe4932	technokami.in@gmail.com	Yes	Confirmed	Enabled
a0486121-bc1b-4f06-bc49-5875021b00ed	vivek.r.patel1998@gmail.com	Yes	Confirmed	Enabled
a5fd145a-0e87-4173-9805-7a034078e6e5	rahulkherajani20@gmail.com	Yes	Confirmed	Enabled
a6be14cd-21fb-4a04-a533-06def23f98ab	pankti.vyas21@gmail.com	No	Unconfirmed	Enabled
b54b39e2-f71d-45c8-aa09-626f6090c4d0	mugdha.agharkar@gmail.com	Yes	Confirmed	Enabled
d9dbac64-9221-49f9-83ce-aa3bf116ecc5	jay.sonani@dal.ca	Yes	Confirmed	Enabled

Figure 6: User created in Cognito userpool with 'Unconfirmed' status.

The screenshot shows a Gmail inbox with 9,064 unread messages. An email from 'no-reply@verificationemail.com' is selected, with the subject 'Your verification code'. The email body contains the text: 'Your confirmation code is 454321'. Below the email are 'Reply' and 'Forward' buttons.

Figure 7: OTP received in user's email inbox.

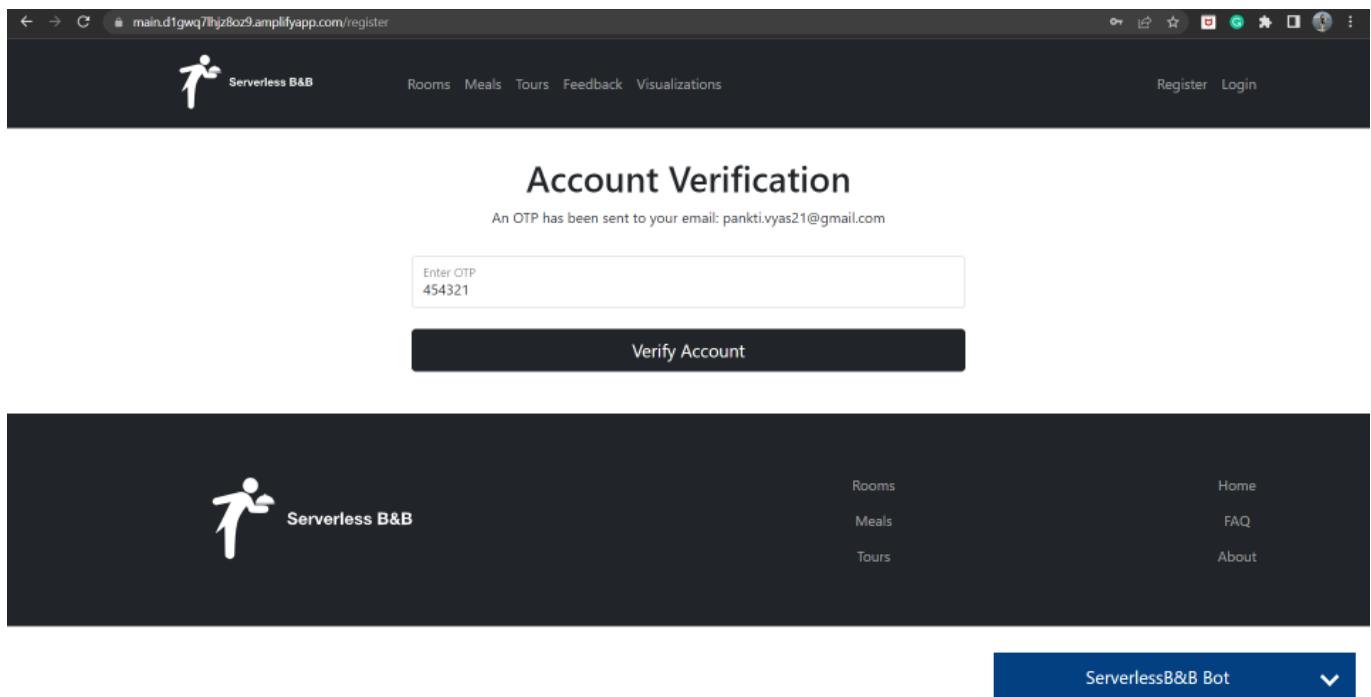

Figure 8: OTP entered in the application.

The screenshot shows the AWS Cognito 'Users' page. The URL is 'us-east-1.console.aws.amazon.com/cognito/v2/idp/user_pools/us-east-1_tw6DYffS/users?region=us-east-1'. The page displays a table of users with columns: User name, Email address, Email verified, Confirmation status, and Status. One user, 'a6be14cd-21fb-4a04-a533-06dcf23f98ab', is highlighted with a blue border. This user's 'Confirmation status' was initially 'Unconfirmed' and 'Status' was 'Enabled'. After validation, both columns now show 'Confirmed' and 'Status' is now 'Enabled'.

Figure 9: User status changes to 'Confirmed' after otp validation.

After the otp is validated, user will be shown a dropdown of 5 security question. User can select any one of them and enter the answer in the text box. The selected question, answer and user's email will be sent to a cloud function 'store-security-question' as parameters in a post request body. The cloud function 'store-security-question' adds these parameters to a 'security-questions' collection in GCP Firestore.

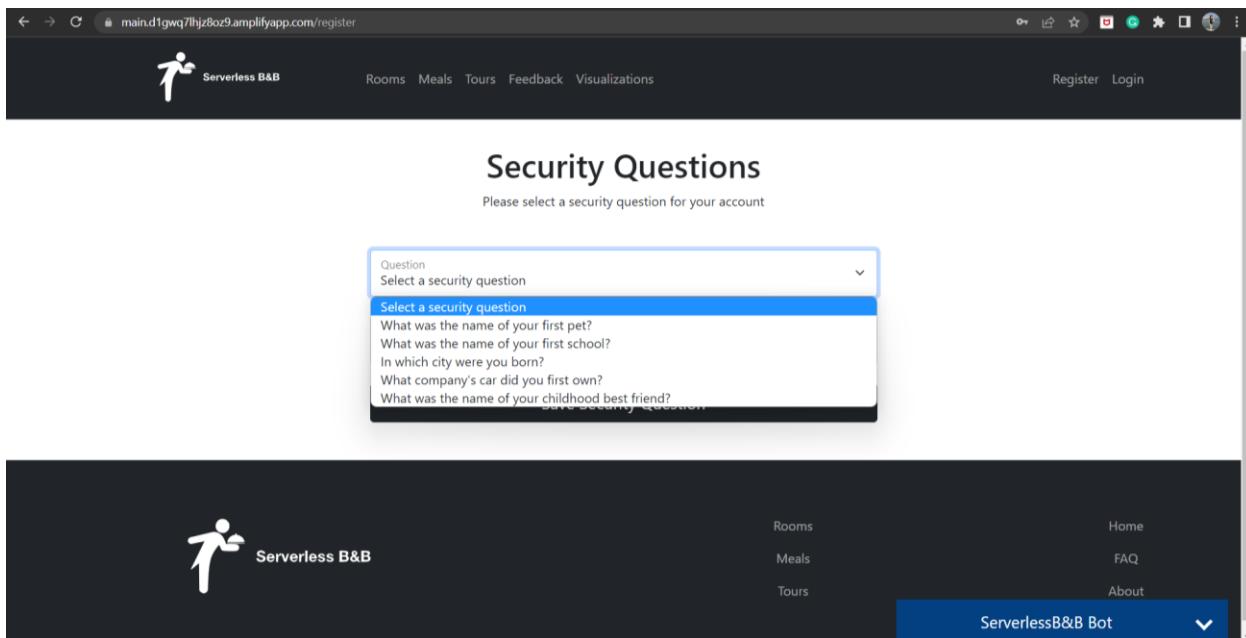

Figure 10: Security Questions dropdown.

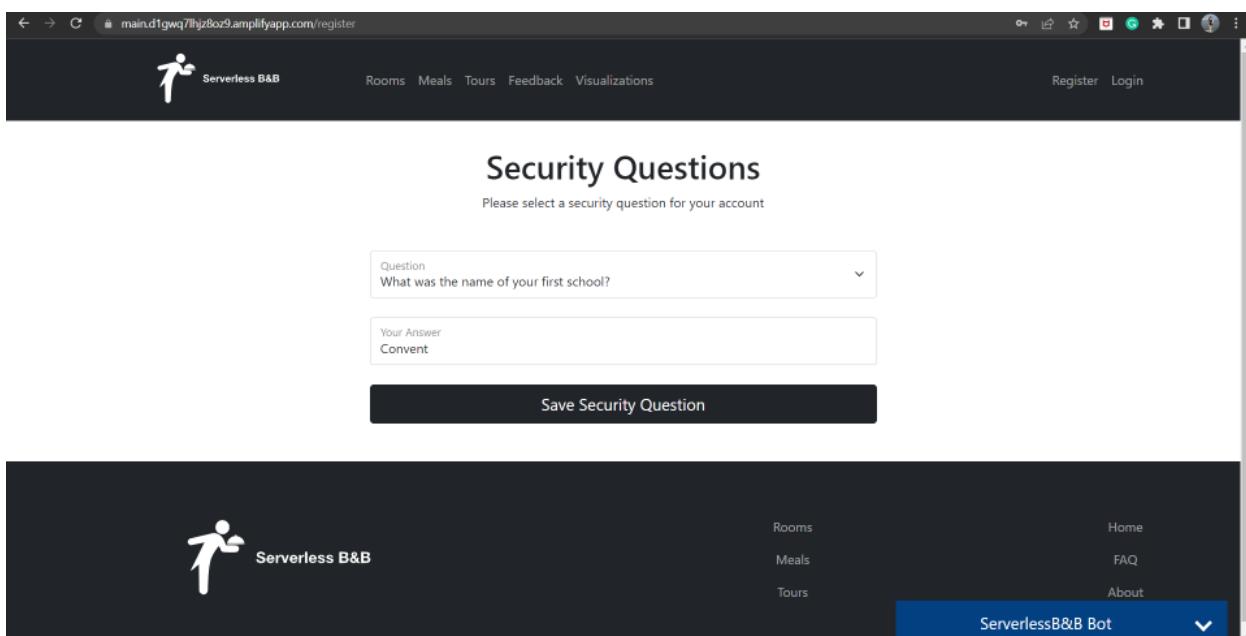

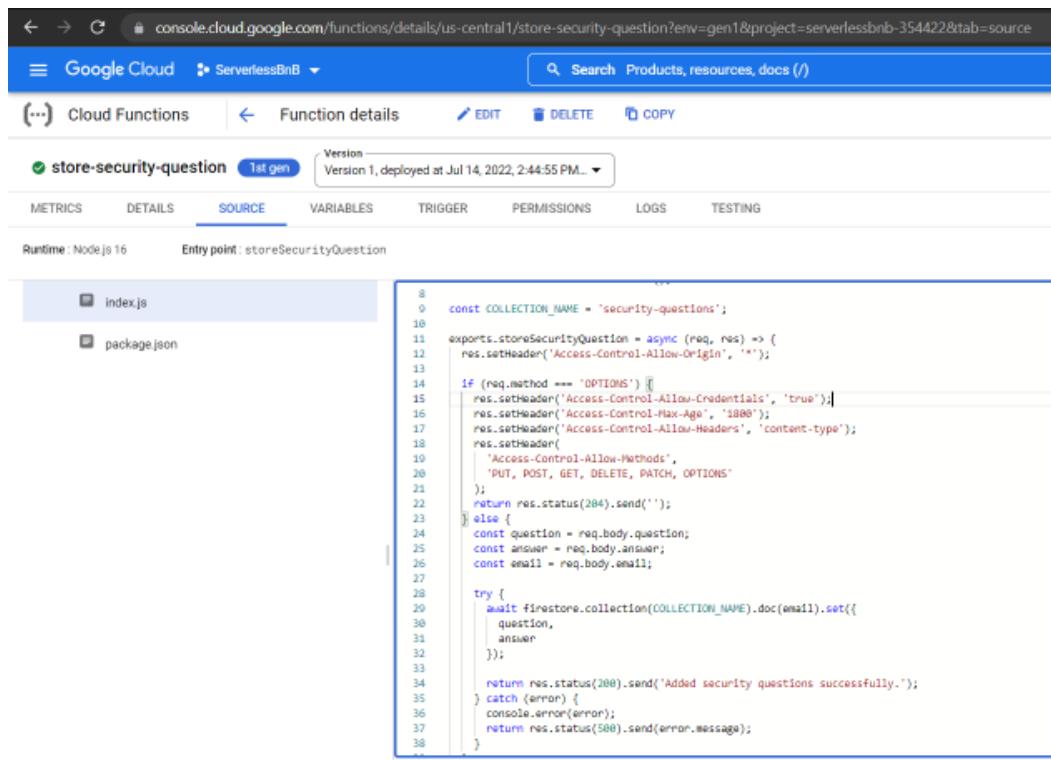

Figure 11: Security Question selected, and answer entered.

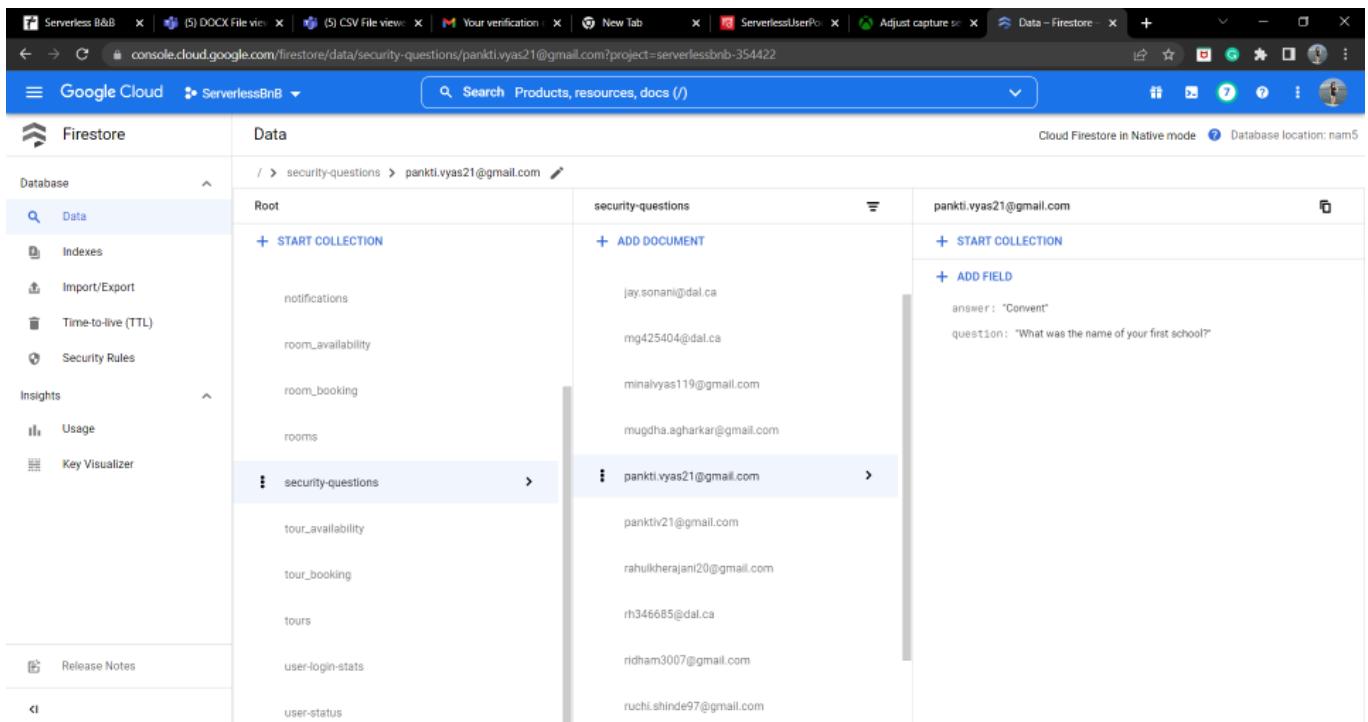

The screenshot shows the Google Cloud Functions console for the 'store-security-question' function. The function is deployed to version 1 at Jul 14, 2022, 2:44:55 PM. The code is written in Node.js 16 and is located in index.js. The entry point is 'storeSecurityQuestion'. The code handles both OPTIONS and POST requests to add security questions to a Firestore collection.

```

8  const COLLECTION_NAME = "security-questions";
9
10 exports.storeSecurityQuestion = async (req, res) => {
11   res.setHeader('Access-Control-Allow-Origin', '*');
12
13   if (req.method === 'OPTIONS') {
14     res.setHeader('Access-Control-Allow-Credentials', 'true');
15     res.setHeader('Access-Control-Max-Age', '1800');
16     res.setHeader('Access-Control-Allow-Headers', 'content-type');
17     res.setHeader(
18       'Access-Control-Allow-Methods',
19       'PUT, POST, GET, DELETE, PATCH, OPTIONS'
20     );
21     return res.status(204).end('');
22   } else {
23     const question = req.body.question;
24     const answer = req.body.answer;
25     const email = req.body.email;
26
27     try {
28       await firestore.collection(COLLECTION_NAME).doc(email).set({
29         question,
30         answer
31       });
32
33       return res.status(200).send('Added security questions successfully.');
34     } catch (error) {
35       console.error(error);
36       return res.status(500).send(error.message);
37     }
38   }
}

```

Figure 12: store-security-question cloud function.

The screenshot shows the Google Cloud Firestore console. A new document was added to the 'security-questions' collection under the user 'pankti.vyas21@gmail.com'. The document contains fields 'answer' (Convent) and 'question' (What was the name of your first school?).

Field	Type	Value
answer	String	Convent
question	String	What was the name of your first school?

Figure 13: Document added to 'security-questions' collection.

For the final registration step, user is asked to enter a Caesar cipher key between 0 and 25. This key will be used on login to authenticate the user. The entered key and user's email will be sent to a cloud function 'store-cipher-key' as parameters in a post request body. The cloud function 'store-cipher key' creates a document in the 'caeser-keys' collection in GCP Firestore with users email and adds the key to the document.

Caesar Cipher Key

Please input an integer value between 0 and 25 as your key.

Your Cipher Key

ServerlessB&B Bot

Figure 15: Cipher key validation for an integer between 0 and 25.

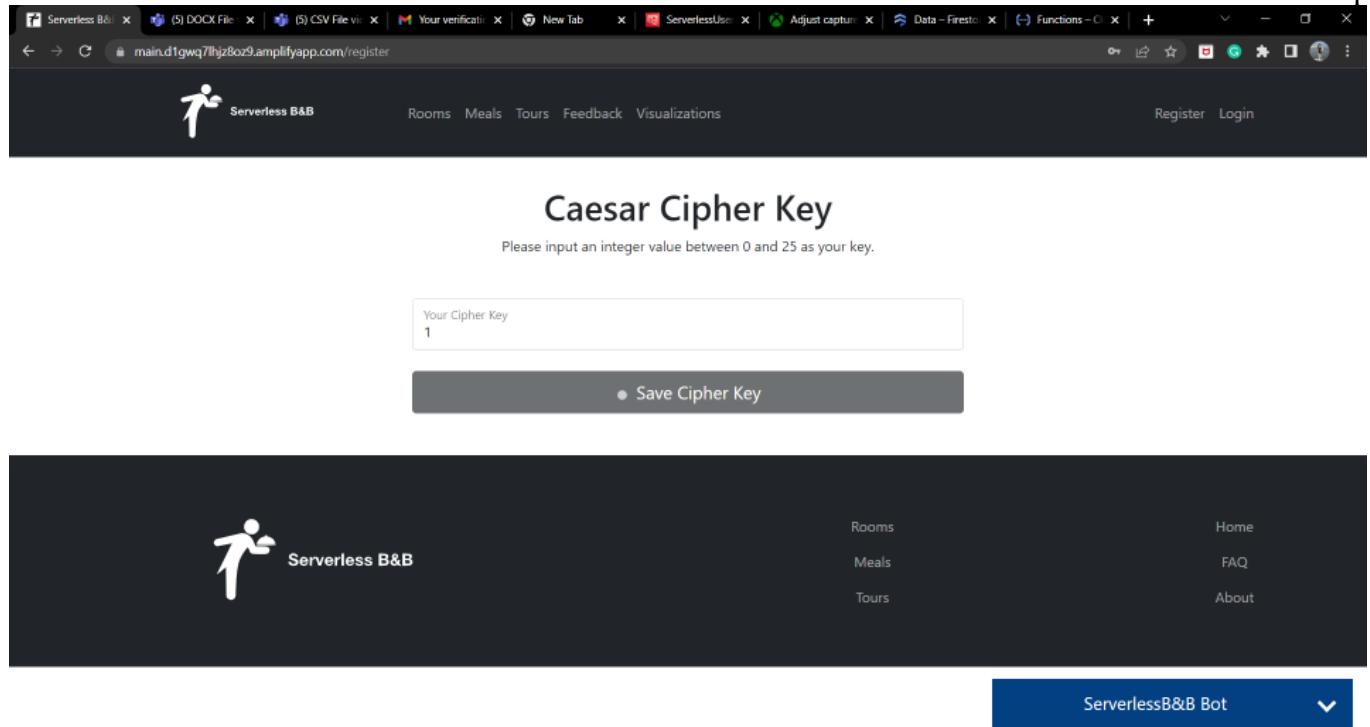

Figure 16: A valid cipherkey entered.

The screenshot shows the Google Cloud Functions console. The URL is 'console.cloud.google.com/functions/details/us-central1/store-cipher-key?env=gen1&project=serverlessbnb-354422&tab=source'. The function name is 'store-cipher-key'. It shows Version 1, deployed at Jul 23, 2022, 12:31:31 P... The runtime is Node.js 16 and the entry point is 'storeCipherKey'. The 'SOURCE' tab is selected, showing the code for 'index.js'. The code is as follows:

```

9  const COLLECTION_NAME = 'caesar_keys';
10
11 exports.storeCipherKey = async (req, res) => {
12   res.setHeader('Access-Control-Allow-Origin', '*');
13
14   if (req.method === 'OPTIONS') {
15     res.setHeader('Access-Control-Allow-Credentials', 'true');
16     res.setHeader('Access-Control-Max-Age', '1000');
17     res.setHeader('Access-Control-Allow-Headers', 'content-type');
18     res.setHeader(
19       'Access-Control-Allow-Methods',
20       'PUT, POST, GET, DELETE, PATCH, OPTIONS'
21     );
22     return res.status(204).send('');
23   } else {
24     const email = req.body.email;
25     const key = req.body.key;
26
27     try {
28       await firestore.collection(COLLECTION_NAME).doc(email).set({
29         key: parseInt(key)
30       });
31
32       return res.status(200).send('Added cipher key successfully.');
33     } catch (error) {
34       console.error(error);
35       return res.status(500).send(error.message);
36     }
37   }
38 };

```

Figure 17: 'store-cipher-key' cloud function.

The screenshot shows the Google Cloud Firestore interface. On the left, the sidebar includes sections for Database, Data, Indexes, Import/Export, Time-to-live (TTL), Security Rules, Insights, Usage, and Key Visualizer. Under the Data section, it shows a hierarchy: Root > caesar_keys > pankti.vyas21@gmail.com. A new document was just added under 'pankti.vyas21@gmail.com' with the key '1'. The document contains a single field 'key' with the value '1'. Other documents in the same collection include mg425404@dal.ca, minalyas119@gmail.com, muqodha.aqharkar@gmail.com, rahulkherajani20@gmail.com, rh346685@dal.ca, ridham3007@gmail.com, ruchi.shinde97@gmail.com, technokami.in@gmail.com, and vivek.r.patel1998@gmail.com.

Figure 18: Document added to 'Caesar keys' collection.

Now the registration steps are complete, user is asked to Login and provided with a link to the login page.

The screenshot shows a web browser displaying the registration page for 'Serverless B&B'. The URL is main.d1gwq7lhjz8oz9.amplifyapp.com/register. The page features a navigation bar with links for Rooms, Meals, Tours, Feedback, and Visualizations, along with Register and Login buttons. A success message in a green box states: "Your account has been created successfully. Please [Log In](#) to start using our services!" Below the message, the 'Serverless B&B' logo is displayed. At the bottom of the page, there are links for Rooms, Meals, Tours, Home, FAQ, and About. A blue footer bar at the very bottom contains the text "ServerlessB&B Bot" and a dropdown arrow icon.

Figure 19: Registration complete.

Pseudo Code

Registration

1. User is asked to input first name, last name, email, and password.
2. These attributes are validated.
3. New user with unconfirmed status is created in the user pool using ‘amazon-cognito-identity-js’ library.
4. User is sent an OTP to email.
5. User is asked to input the OTP.
6. OTP is validated and user status is confirmed.
7. User is asked to choose one security question from a dropdown and answer it.
8. The question and answer are then stored to firestore collection with the help of a cloud function.
9. User is requested for an integer key between 0 and 25.
10. This cipher key is stored to firestore with the help of a cloud function.
11. Registration process is complete.

Module 2: Authentication Module

For login, user must go through 3 steps. The first step would be the credentials validation followed by 2 factor authentication. Two factor authentication consists of security question answer authentication and Caesar cipher authentication.

Initially, user will be asked to input the email and password. These credentials will then be validated with the help of ‘amazon-cognito-identity-js’ library.

The screenshot displays the login interface for the "Serverless B&B" application. At the top, there is a header bar with the URL "main.d1gwq7lhjz8oz9.amplifyapp.com/login". Below the header, the main content area has a title "Login to Enter!" and two input fields: "Email" and "Password". A large "Log In" button is centered below the password field. At the bottom of the page, there is a footer navigation bar with several links: "Rooms", "Meals", "Tours", "Feedback", "Visualizations", "Register", "Login", "Home", "FAQ", and "About". A blue button labeled "ServerlessB&B Bot" is also visible at the bottom right.

Figure 20: Login form.

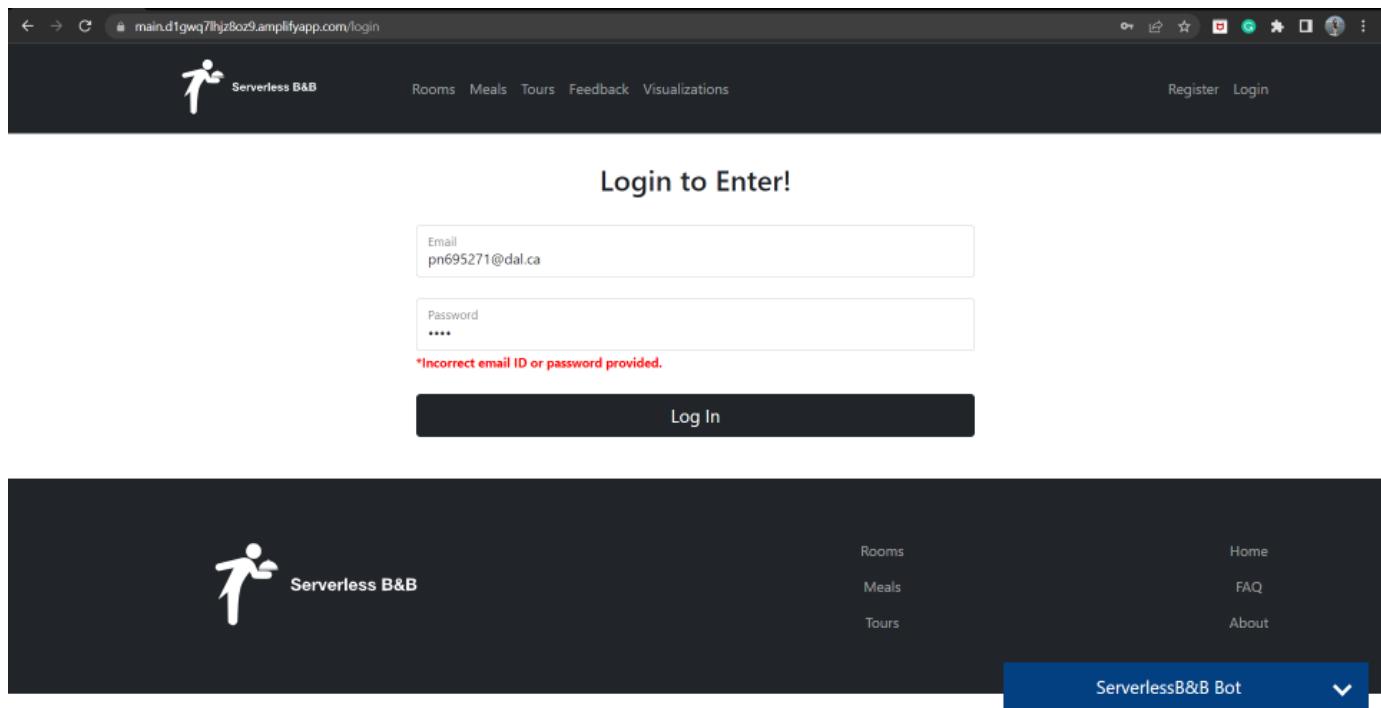

Figure 21: Invalid credentials error.

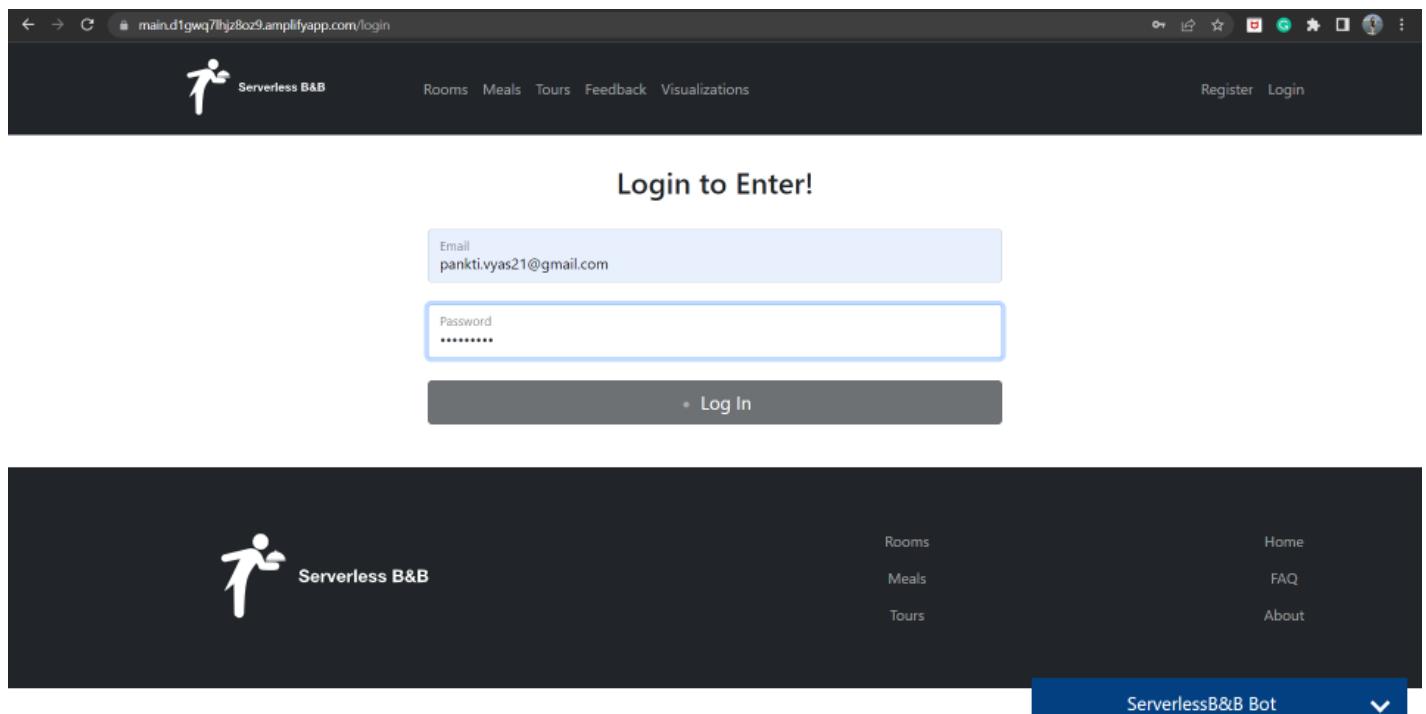

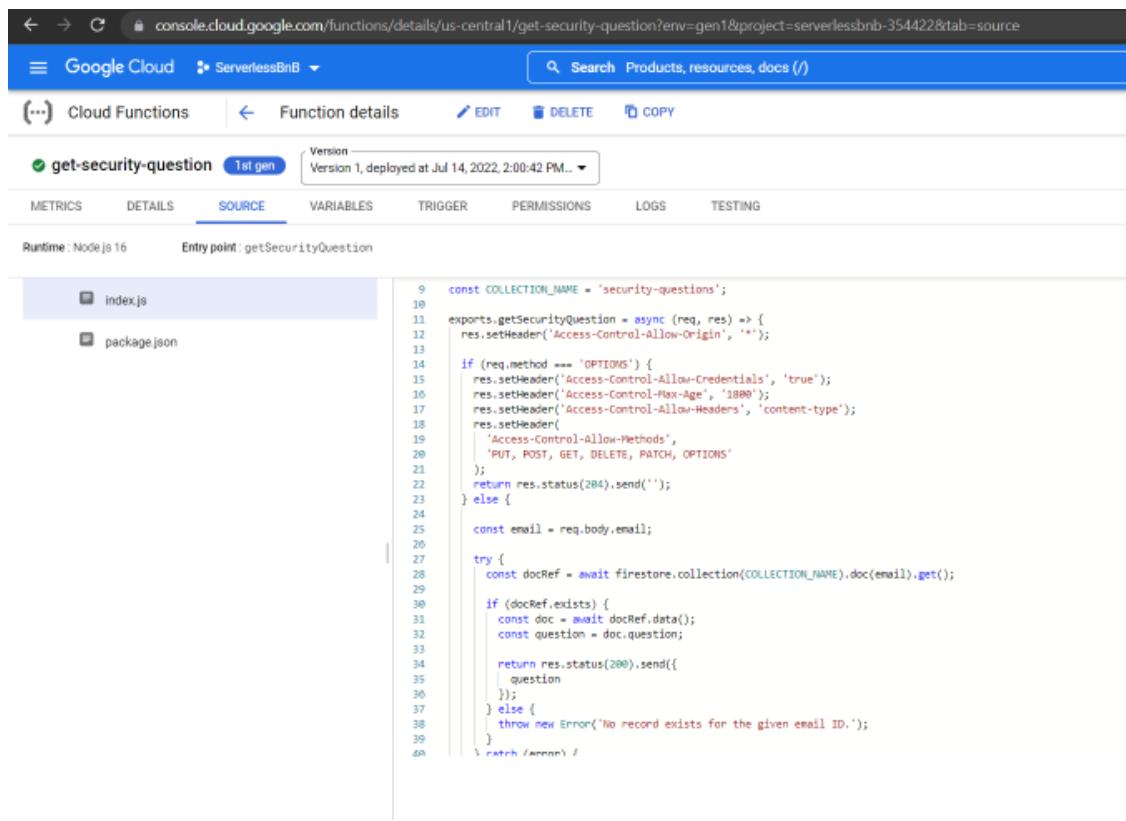

Figure 22: Valid credentials added to Login form.

Now, the security question that user selected while registering needs to be accessed from the ‘security-questions’ collection in Firestore. This is done by ‘get-security-question’ cloud function. It gets the user’s email in the post request and retrieves the security question from the document with the same email in the ‘security-questions’ collection and returns the question in the response. This question is then displayed to the user and the answer is requested.

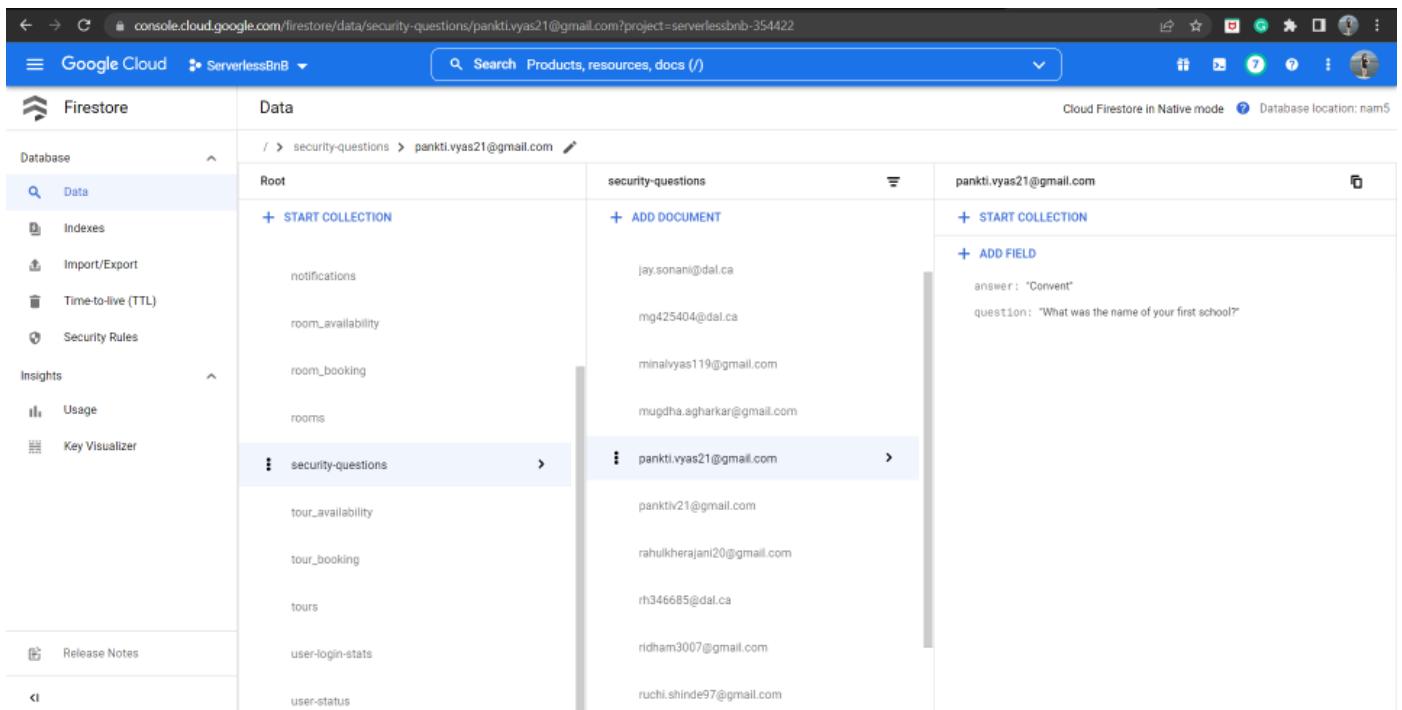

The screenshot shows the Google Cloud Functions console for the 'get-security-question' function. The function is deployed to version 1, which was deployed at Jul 14, 2022, 2:00:42 PM. The runtime is Node.js 16, and the entry point is 'getSecurityQuestion'. The code is written in JavaScript and handles requests for security questions based on an email address.

```

9  const COLLECTION_NAME = 'security-questions';
10 exports.getSecurityQuestion = async (req, res) => {
11   res.setHeader('Access-Control-Allow-Origin', '*');
12
13   if (req.method === 'OPTIONS') {
14     res.setHeader('Access-Control-Allow-Credentials', 'true');
15     res.setHeader('Access-Control-Max-Age', '1800');
16     res.setHeader('Access-Control-Allow-Headers', 'content-type');
17     res.setHeader(
18       'Access-Control-Allow-Methods',
19       ['PUT, POST, GET, DELETE, PATCH, OPTIONS']
20     );
21     return res.status(204).send('');
22   } else {
23
24     const email = req.body.email;
25
26     try {
27       const docRef = await firestore.collection(COLLECTION_NAME).doc(email).get();
28
29       if (docRef.exists) {
30         const doc = await docRef.data();
31         const question = doc.question;
32
33         return res.status(200).send({
34           question
35         });
36       } else {
37         throw new Error('No record exists for the given email ID.');
38       }
39     } catch (error) {
40
41   }
}

```

Figure 23: 'get-security-question' cloud function.

The screenshot shows the Google Firestore console. The left sidebar shows the database structure with collections like 'Indexes', 'Import/Export', 'Time-to-live (TTL)', 'Security Rules', 'Usage', and 'Key Visualizer'. The main area displays the 'security-questions' collection under the 'pankti.vyas21@gmail.com' document. The collection contains documents for various users, each with fields 'answer' and 'question'.

User Email	question	answer
jay.sonani@dal.ca	What is your favorite color?	Red
mg425404@dal.ca	What is your favorite hobby?	Gardening
minalvyas119@gmail.com	What is your favorite movie?	Avatar
mugdha.agarkar@gmail.com	What is your favorite book?	The Great Gatsby
pankti.vyas21@gmail.com	What is your favorite food?	Pasta
panktiv21@gmail.com	What is your favorite sport?	Football
rahulkherajani20@gmail.com	What is your favorite travel destination?	New York City
rh346685@dal.ca	What is your favorite movie?	Star Wars
ridham3007@gmail.com	What is your favorite book?	The Catcher in the Rye
ruchi.shinde97@gmail.com	What is your favorite food?	Curry

Figure 24: Security question is accessed from 'security-questions' collection.

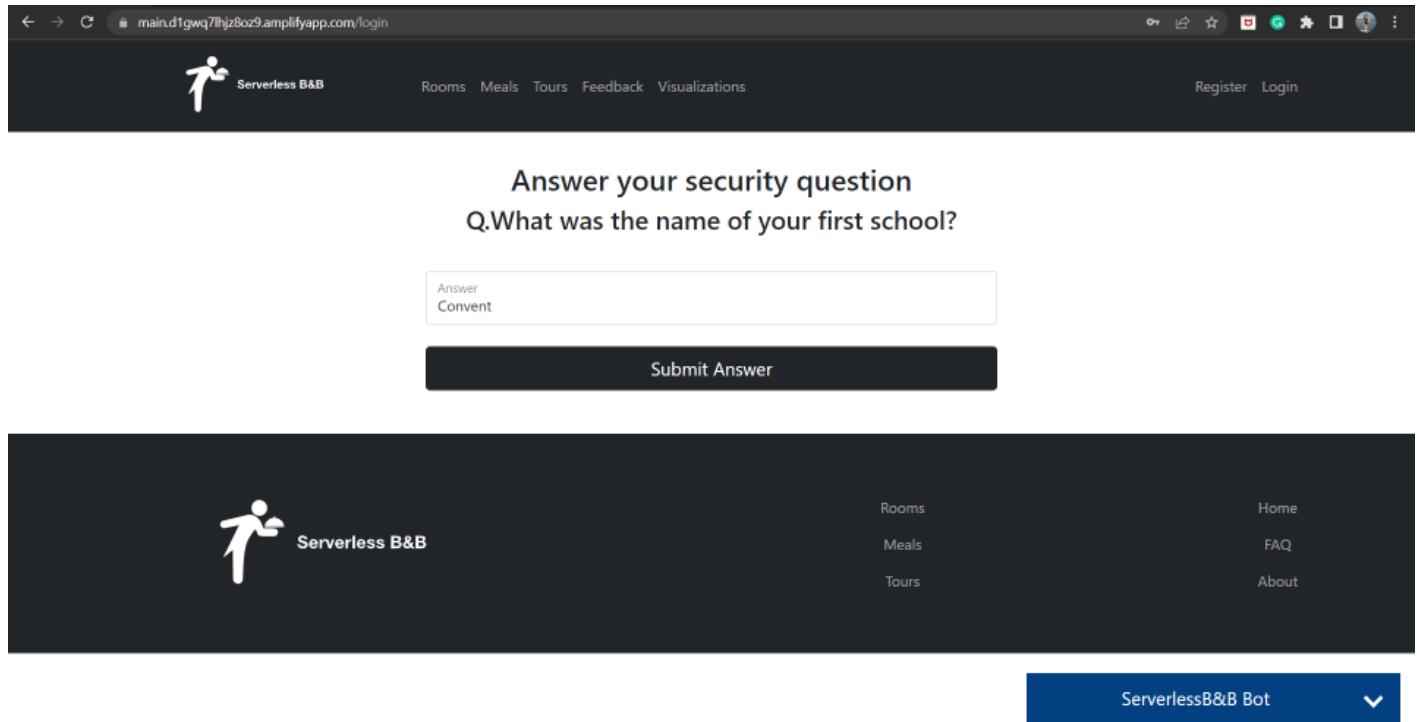

Figure 25: Security question displayed and answer for the security question is required to be entered.

Once the answer to the security question is entered it is passed to the ‘validate-security-question-answer’ cloud function within a post request body. This answer is then matched with the correct answer stored in the ‘security-questions’ collection which was stored while registering. If the answer is matched a success response is returned or else an error is thrown.

```

9  const COLLECTION_NAME = 'security-questions';
10
11 exports.validateSecurityQuestionAnswer = async (req, res) => {
12   res.setHeader('Access-Control-Allow-Origin', '*');
13
14   if (req.method === 'OPTIONS') {
15     res.setHeader('Access-Control-Allow-Credentials', 'true');
16     res.setHeader('Access-Control-Max-Age', '1800');
17     res.setHeader('Access-Control-Allow-Headers', 'content-type');
18     res.setHeader(
19       'Access-Control-Allow-Methods',
20       ['PUT, POST, GET, DELETE, PATCH, OPTIONS']
21     );
22     return res.status(204).send('');
23   } else {
24     const email = req.body.email;
25     const answer = req.body.answer;
26
27     try {
28       const docRef = await firestore.collection(COLLECTION_NAME).doc(email).get();
29       if (!docRef.exists) {
30         const doc = await docRef.set({
31           correctAnswer: doc.ref,
32
33           if (answer === correctAnswer) {
34             res.status(200).send('SUCCESS');
35           } else {
36             throw new Error('Incorrect answer.');
37           }
38         });
39       } else {
40         throw new Error('No record exists for the given email ID.');
41       }
42     }
43   }
44 }

```

Figure 26: 'validate-security-question-answer' cloud function.

In this final step, the user must use their key to encrypt a given plain text. This plain text is a five-character long alphabetic string randomly generated on the frontend. After entering the cipher text, when user hits the Submit button, three fields will be sent to API hosted on GCP API Gateway. The plain text, the cipher text and the user

id. This API will trigger the Cloud function “caesar-cipher”. This cloud function will first of all, retrieve all three fields from the request. Then, using the user id, it will fetch the key for that user from the “caesar_keys” collection on Firebase. Using that key, a correct cipher text is generated from the plain text. This generated cipher text is then compared with the one that user has entered, retrieved from the request. A True or False as a “success” flag is sent back in the response along with the correct generated cipher text.

Testing

Invalid Input

Figure 27 shows the screenshot when the wrong answer entered in the cipher text field

Figure 27: Invalid cipher input.

Figure 28 shows the landing screen upon entering the correct cipher text in the third step of the authentication.

Figure 28: Login successful after 3-step authentication.

To perform this operation, we have created a collection “caesar_keys” in Firebase database. This collection will contain one document per user. The id of this document is user’s user id, i.e., email. This document will have one key-value pair as “key” and its value as a number. Figure 29 shows the “caesar_keys” collection and keys stored inside the collection for different users on Firebase.

The screenshot shows the Firebase Cloud Firestore interface. On the left, the sidebar includes 'Project Overview', 'Firestore Database' (selected), 'Build', 'Release and monitor', 'Analytics', 'Engage', 'All products', and 'Customise your navigation'. The main area shows the 'caesar_keys' collection under 'jay.sonani@dal.ca'. A document for 'jay.sonani@dal.ca' is selected, showing the field 'key: 1'. Other documents listed include 'abc@example.com', 'agharkar.mugdha@gmail.com', 'minalvyas119@gmail.com', 'mugdha.agharkar@gmail.com', 'rahulkherajani20@gmail.com', 'rh346685@dal.ca', 'ridham3007@gmail.com', 'technokami.in@gmail.com', and 'vivek.r.patel1998@gmail.com'.

Figure 29: Firebase “caesar_keys” collection.

From the frontend, a POST http request is sent to GCP API Gateway on the end point /caesar-cipher. A cloud function trigger URL with other necessary configurations are mentioned in the config.yaml file for API Gateway. Figure 30 shows the config file containing the caesar-cipher configuration.

The screenshot shows the Google Cloud Platform API Gateway configuration for the 'config12' service. On the left, the 'config.yaml' file is displayed, showing the configuration for the '/caesar-cipher' endpoint. The 'x-google-backend' section specifies the address as <https://us-central1-serverlessbnb-354422.cloudfunctions.net/caesar-cipher>. On the right, the 'permissions' tab is open, showing the 'config12' role with inheritance enabled. It lists 'Editor' and 'Owner' roles with specific users assigned.

Figure 30: Caesar-cipher configuration for API Gateway.

Using configuration shown in the Figure 30, the caesar-cipher cloud function will be invoked. Figure 31 shows the cloud function caesar-cipher that will be invoked via API Gateway

```

1 import string
2 import firebase_admin
3 from firebase_admin import credentials
4 from firebase_admin import firestore
5
6 alphabet = string.ascii_lowercase.upper()
7
8 def main(request):
9     headers = {
10         'Access-Control-Allow-Origin': '*',
11     }
12     if(request.method == 'OPTIONS'):
13         headers = {
14             'Access-Control-Allow-Origin': '*',
15             'Access-Control-Allow-Methods': 'PUT, POST, GET, DELETE, PATCH, OPTIONS',
16             'Access-Control-Allow-Headers': 'Content-Type',
17             'Access-Control-Max-Age': '3600',
18         }
19     return('', 204, headers)
20
21

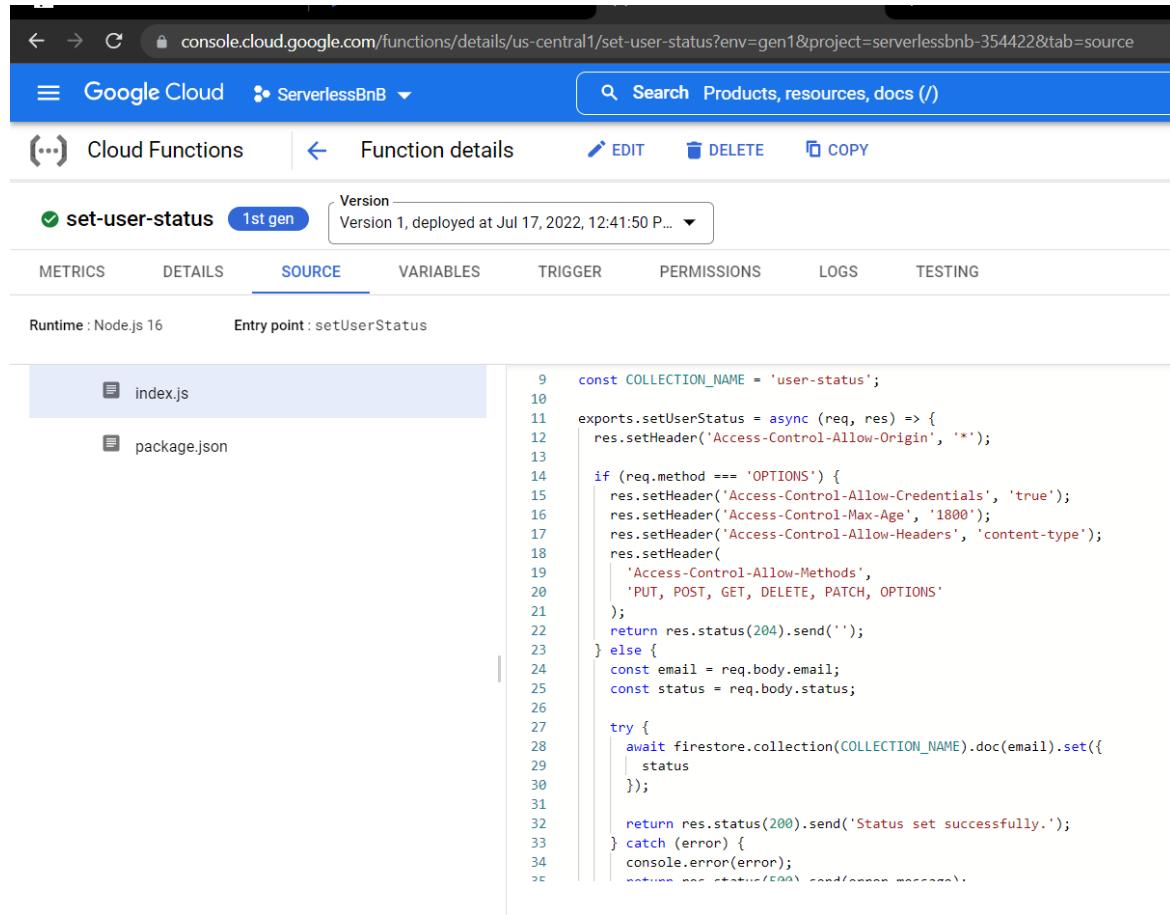

```

Figure 31: Cloud function “caesar-cipher”.

Pseudo Code

- User is prompted with the plain text.
- User uses their key to encrypt the text.
- User enters the encrypted cipher text.
- User hits the submit button.
- Cipher text, plain text and user Id are sent to API.
- Actual cipher text is generated using the key from the database.
- Cipher text user entered is compared with the actual generated cipher text.
- If they match, returned success as True in the response.
- If they don't match, returned success as False in the response.

Once the user is logged in, the email appears on the top right of the navbar. This indicated that the user is authenticated and the session is currently active. On successful login user status is set to ‘true’ in the ‘user-status’ collection. This is done using the ‘set-user-status’ cloud function which gets the email and status as parameters in a post request and updates the status to Firestore.

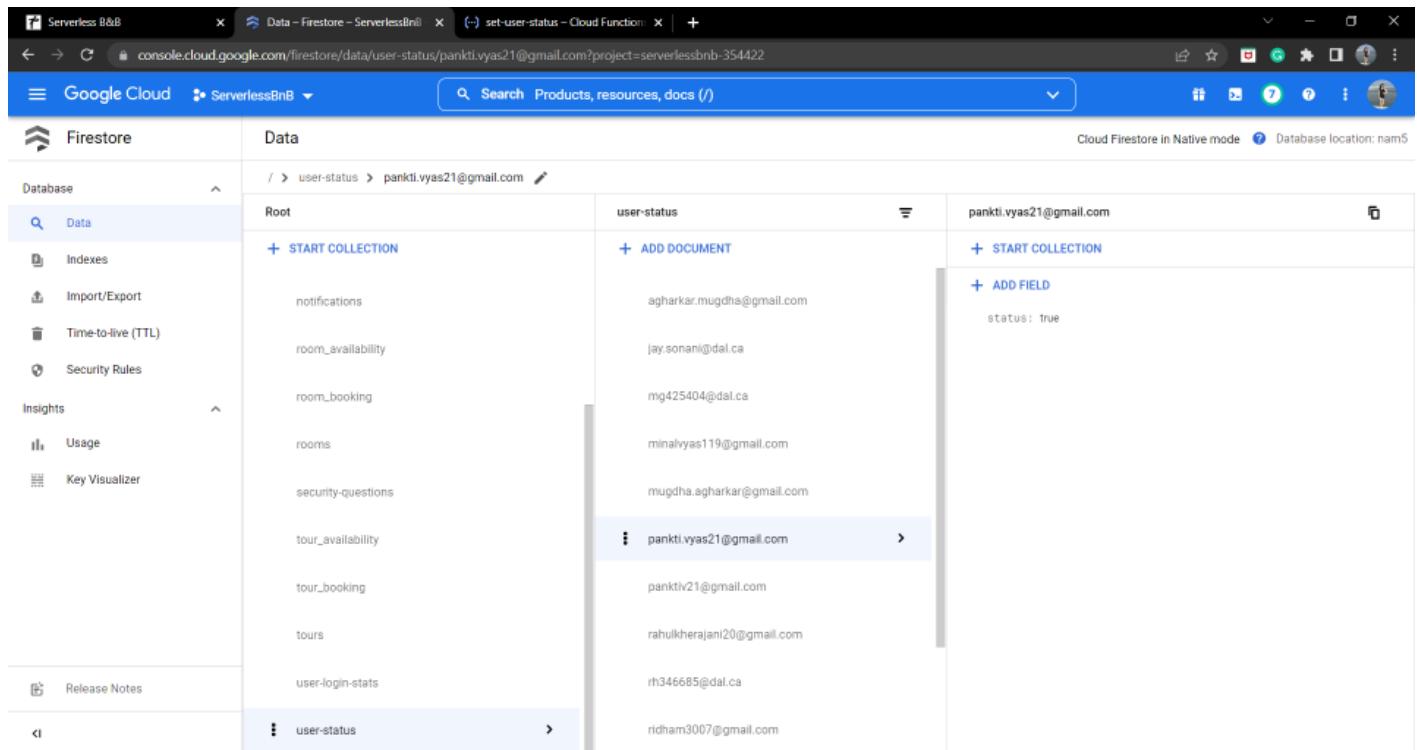

The screenshot shows the Google Cloud Functions interface for the 'set-user-status' function. The function is in its first generation, deployed at Jul 17, 2022, 12:41:50 P... Version 1. The 'SOURCE' tab is selected, displaying the code for index.js:

```

9  const COLLECTION_NAME = 'user-status';
10
11 exports.setUserStatus = async (req, res) => {
12   res.setHeader('Access-Control-Allow-Origin', '*');
13
14   if (req.method === 'OPTIONS') {
15     res.setHeader('Access-Control-Allow-Credentials', 'true');
16     res.setHeader('Access-Control-Max-Age', '1800');
17     res.setHeader('Access-Control-Allow-Headers', 'content-type');
18     res.setHeader(
19       'Access-Control-Allow-Methods',
20       'PUT, POST, GET, DELETE, PATCH, OPTIONS'
21     );
22     return res.status(204).send('');
23   } else {
24     const email = req.body.email;
25     const status = req.body.status;
26
27     try {
28       await firestore.collection(COLLECTION_NAME).doc(email).set({
29         status
30       });
31
32       return res.status(200).send('Status set successfully.');
33     } catch (error) {
34       console.error(error);
35       return res.status(500).send(error.message);
36     }
37   }
38 }

```

Figure 32: 'set-user-status' collection.

The screenshot shows the Google Cloud Firestore interface. The left sidebar shows the database structure under the 'user-status' collection, including 'notifications', 'room_availability', 'room_booking', 'rooms', 'security-questions', 'tour_availability', 'tour_booking', 'tours', and 'user-login-stats'. The main area displays the data for the 'user-status' collection, where each document represents a user's status. One document for 'pankti.vyas21@gmail.com' is expanded, showing the field 'status' with the value 'true'.

Document ID	status
pankti.vyas21@gmail.com	true
agharkar.mugdha@gmail.com	
jay.sonani@dal.ca	
mg425404@dal.ca	
minalvyas119@gmail.com

pankti.vyas21@gmail.com	true
panktiv21@gmail.com	
rahulkherajan20@gmail.com	
rh346685@dal.ca	
ridham3007@gmail.com	

Figure 33: Status set to 'true' currently authenticated and logged in user.

The screenshot shows the Google Cloud Firestore interface. On the left, the sidebar includes 'Database' (selected), 'Indexes', 'Import/Export', 'Time-to-live (TTL)', 'Security Rules', 'Insights', 'Usage', and 'Key Visualizer'. The main area shows the 'user-status' collection under 'Root'. A document for 'pankti.vyas21@gmail.com' is selected, showing its fields: 'status' is set to 'false'. Other documents listed include 'agharkar.mugdha@gmail.com', 'jay.sonani@dal.ca', 'mg425404@dal.ca', 'minalvyas119@gmail.com', 'mugdha.agharkar@gmail.com', 'pankti.vyas21@gmail.com' (the selected one), 'panktiv21@gmail.com', 'rahulkherajani20@gmail.com', 'rh346685@dal.ca', and 'ridham3007@gmail.com'.

Figure 34: Status set to 'false' after logout.

Pseudo Code

Login

1. User is asked to input email and password.
2. These attributes are validated.
3. Credentials are validated.
4. Security question that user entered while registration is retrieved from the firestore collection with the help of a cloud function.
5. User is asked to answer the question.
6. Answer is validated with the answer stored in firestore ‘security-questions’ collection by a cloud function ‘validate-security-question-answer’.
7. The user is then asked to cipher a random string which is then validated.
8. User is now authenticated and logged in.

Module 3: Online Support Module

The online support module is a chat bot which responds to the user’s queries. It provides online virtual assistance for both users, the guest users and the logged in users. The chat bot is implemented using two AWS services that are **AWS Lex** and **AWS Lambda**. For the front end of ServerlessBnB chat bot I have used react library **react-lex-plus** which provides readymade UI for lex. The chat bot provides mainly three functionalities such as basic site navigation, checking room availability and service bookings. The service booking includes services such as room booking, ordering a meal and tour booking. The guest users only have access to basic site navigation and room availability service whereas logged in users have access to all these services. For creating the chat bot, I have used AWS Lex service. The chat bot name is ServerlessBnB. Figures 35 and 36 display the configuration of ServerlessBnB chat bot.

Figure 35: ServerlessBnB chat bot on AWS Lex console

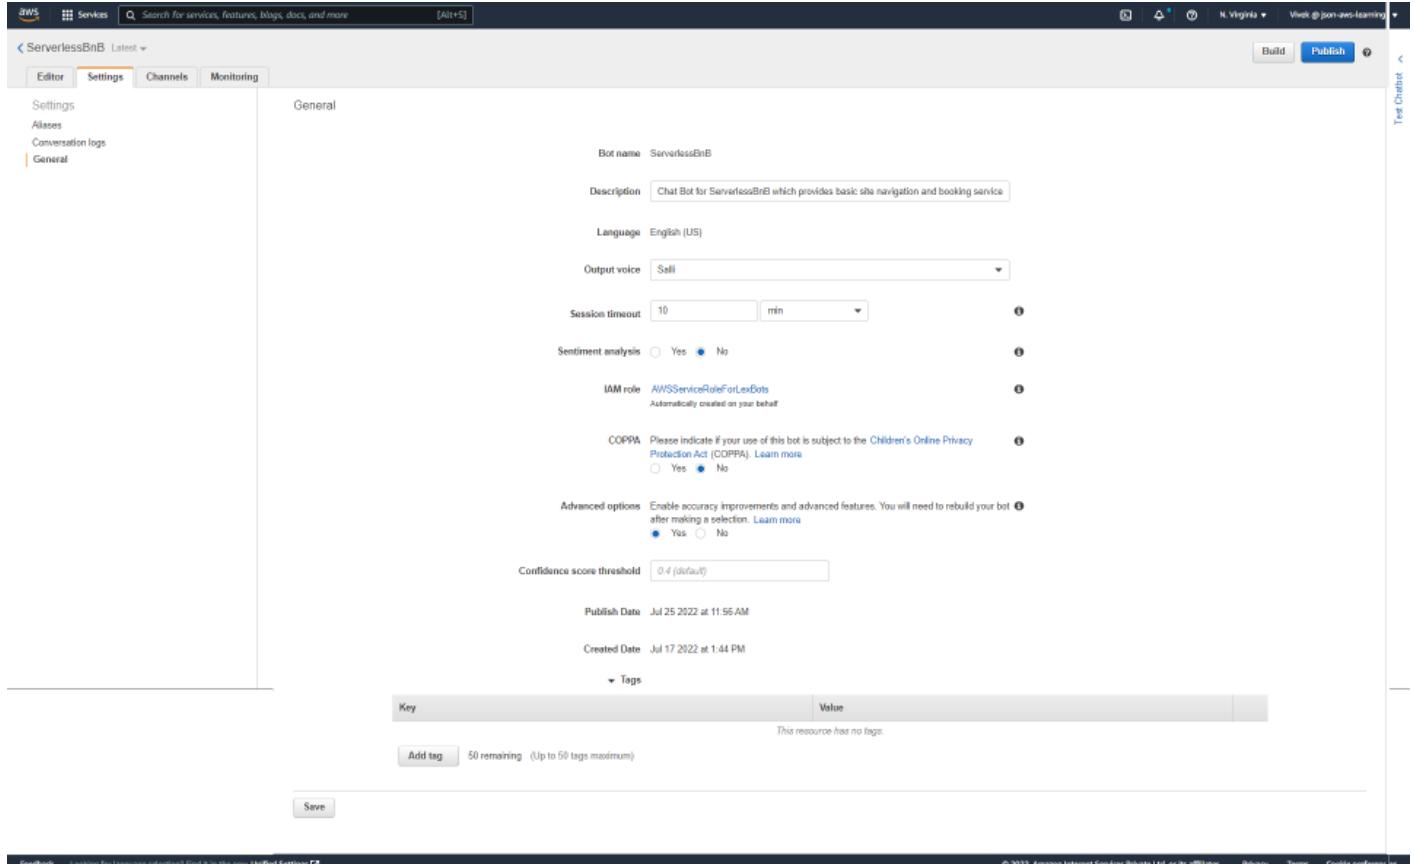

Figure 36: Configuration of ServerlessBnB bot.

As displayed in the Table-2, the chat bot has its internal components such as Intents, Utterances, Slots, and Code Hook. The intent is a specific action or task that the user wishes to complete. I have created total 5 intents for this chat bot. **BookRoom** intent is responsible for room booking, **BookTour** intent handles tour booking, **OrderMeal** intent takes care of meal orders, **RoomAvailability** intent allows to check for available rooms and lastly Navigation intent allows basic site navigation. All these intents are actions that ServelessBnB users want to perform which will be handles automatically by **ServelessBnB** bot using intents. Utterances are textual representations of what a user should type or say to trigger an intent to perform a specific action or task. Slots are the values or pieces of data that the bot intent requires to complete its task. User is usually prompted to provide slot values, or he can provide slot values in utterances itself, e.g., for a OrderMeal intent bot is likely to need slots for meal type and meal quantity. The bot can prompt user to ask for a slot value; for example, “What type of meal you want to order? Our most popular options are: 1. Veg and 2. Non-veg.” or user can provide slot value in utterance itself; for example, “I want to order 2 Veg meals”; in this case the slot values meal type and meal quantity will be automatically retrieved by the bot. I have used built-in slot types as well as custom slot types for

fulfilling the intents. The built-in slot types which I have used are **AMAZON.DATE**, **AMAZON.NUMBER** and **AMAZON.AlphaNumeric**. For some of the data items I have used custom slot types such as **RoomTypes**, **TourTypes** and **MealTypes**. These slot values will be used as an enumeration, with the user's value being resolved to the slot value only if it is the same as one of the slot values or a synonym. [9]

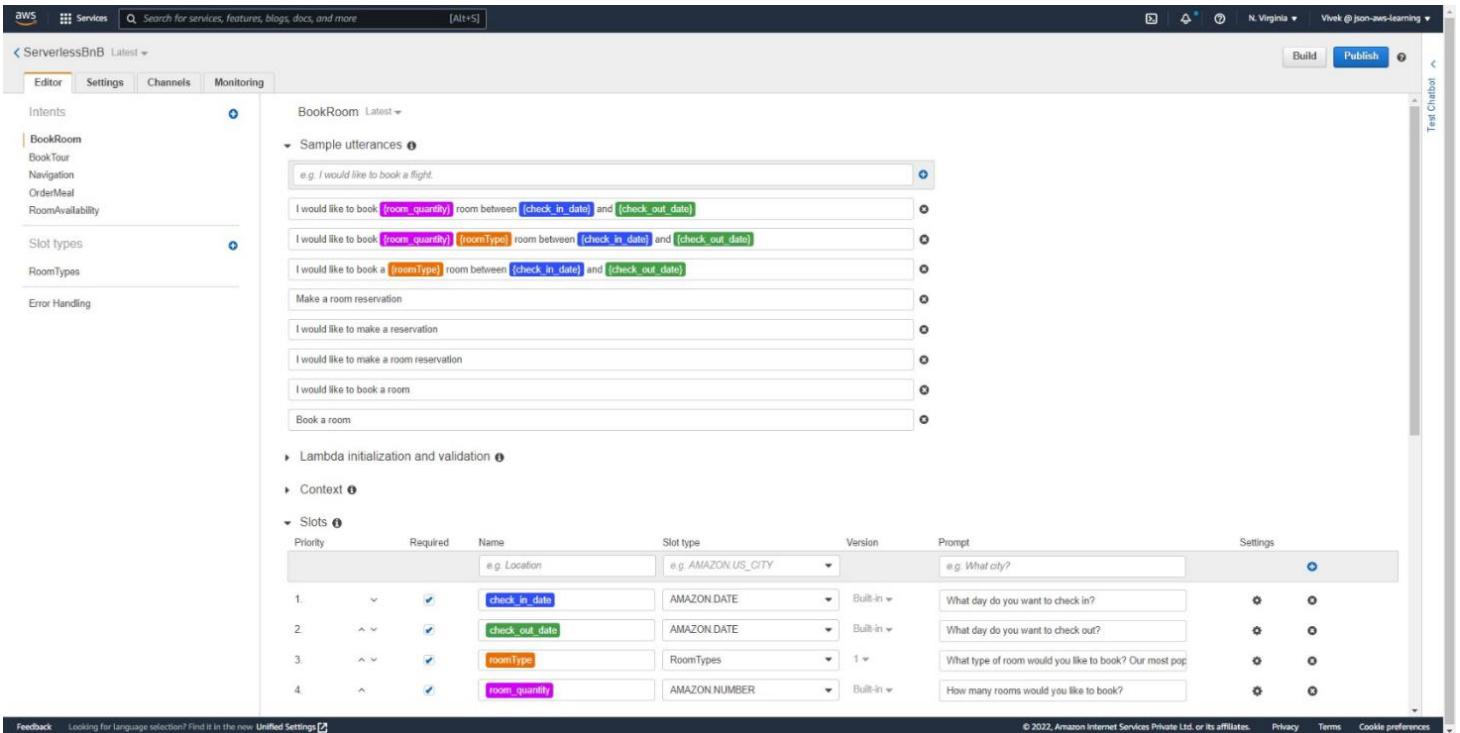

Figure 37: Internal components of AWS Lex ServerlessBnB chat bot.

Table 22: Internal components of ServerlessBnB chat bot.

Intent	Purpose	Slots
BookRoom	For booking a room	Check-in Date, Check-out Date, Room Type and Room Quantity
BookTour	For booking a tour	Tour Type and Number of People
OrderMeal	For ordering a meal	Meal Type and Meal Quantity
RoomAvailability	For checking room availability	Check-in Date and Check-out Date
Navigation	For website navigation	Webpage

For fulfilment of each intent, I have created a Code Hook which in turn triggers AWS Lambda function which handles the logic of fulfilment of the intent based on its type. For this, I have created **ServerlessBnBLex** lambda function as displayed in the Figure-38. Whenever, user wants to perform particular action he will simply interact with the chat bot by providing sample utterances and based on those utterances particular intent will be called and it will ask for the required slot values needed for the fulfilment of the slot based on the task to the user wants to perform. After taking slot values the intent will then trigger the **ServerlessBnBLex** lambda function which will receive event from the lex. The event contains information about the intent such as intent name, session attributes and slot values. Based on the name of the intent the function for handling the task associated with the intent will be called and after executing the business logic the response will be returned to the lex to display it to the user. For example, if user wants to order a meal, then the chat bot first takes slot values such as meal type and meal

quantity from the user and then passes all the intent information along with the slot values to the ServerlessBnBLex Lambda function as an event. The intent name will be retrieved from the event. If the intent name matches with the “OrderMeal” then the `order_meal()` function will be called which carry out necessary, POST request to the **APIGateway** to invoke a **GCP CloudFunction** responsible for database operations for

ordering a meal. Then based on the response of the request the response is created for Lex user and will be returned to the user to get displayed in the chat bot UI.

Figure 38: Lambda function that handles fulfilment of Lex Intent.

Flowchart

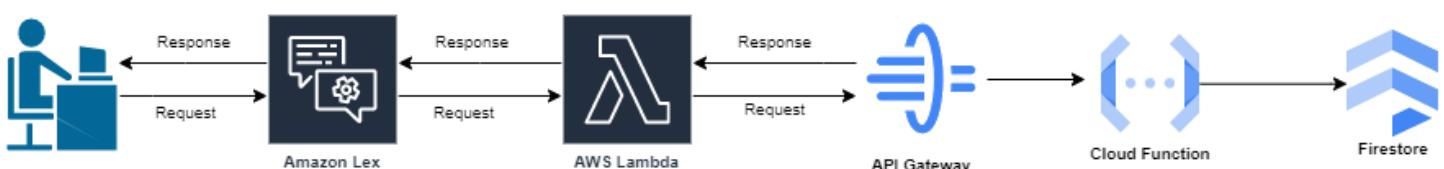

Figure 39: Flowchart of Online Support Module.

Test Cases

- Figure-40 shows the test case for a situation when guest user attempts to use service which are only available for logged in user. Guest user is asked to login first in order to use the service.

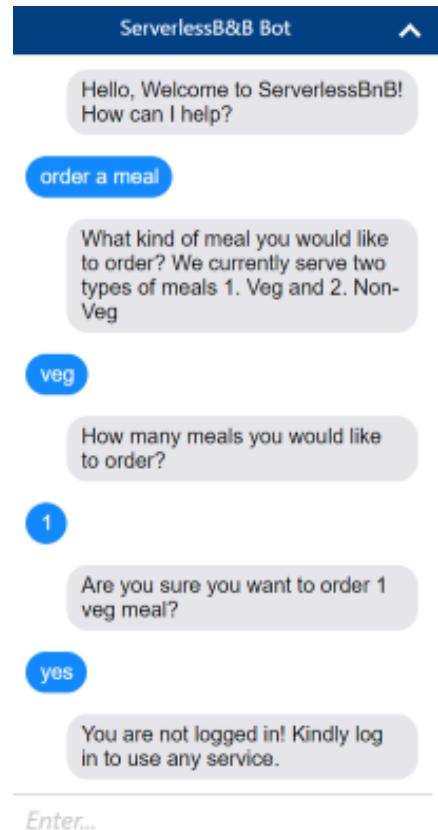

Figure 40: If user is guest user and attempts to use any booking or ordering service through chat bot then he is asked to login first.

- Figure-41 displays screenshot of interaction between user and the ServerlessBnB bot and it involves use of basic site navigation functionality provided through the chat bot.

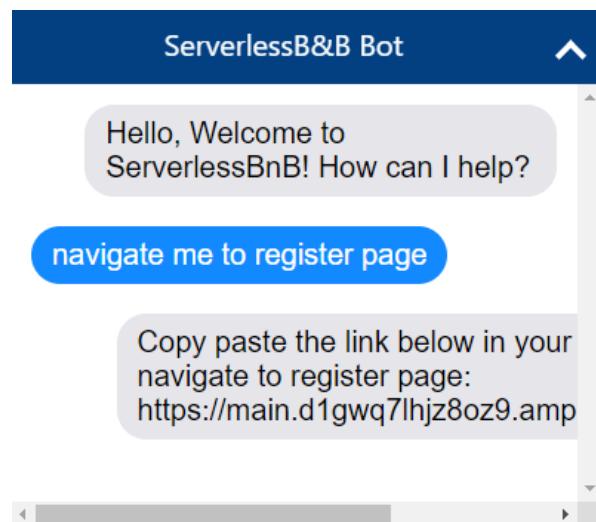

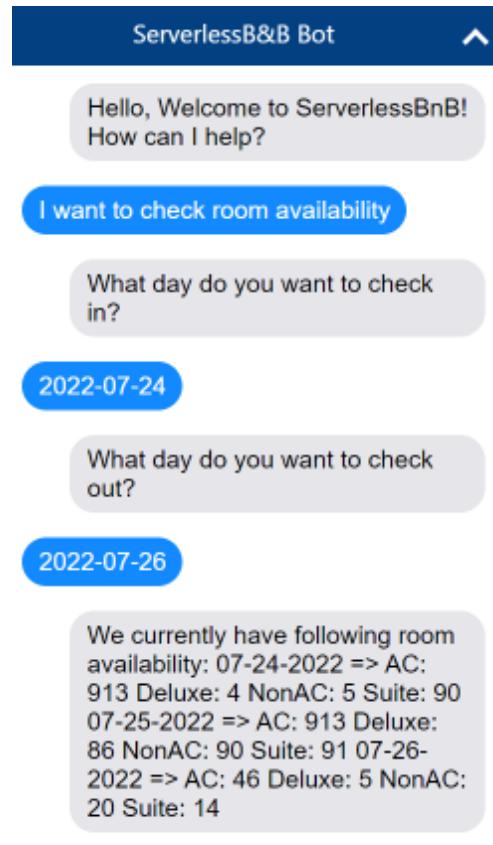

Figure 41: Website navigation request to chat bot and its response.

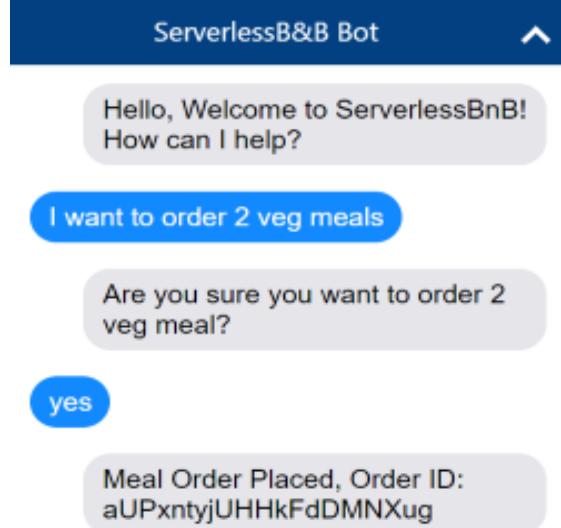

- Figure-42 displays interaction between the guest user and the chat bot, and it involves room availability checking service. The guest user provides possible check-in and check-out date of his stay to check for the availability of the room. The chat bot displays availability in response if any.

Enter...

Figure 42: Guest user checking room availability.

- Figure-43 displays logged in user placing successful meal order through the chat bot. If the sufficient meal quantity is available for the requested meal, then the chat bot places the order and in response displays order id to the user.

Enter...

Figure 43: Logged in user placing successful meal order.

- Figure-44 displays response of Lex chat bot in case when logged in user attempts to order excessive quantity of any meal type.

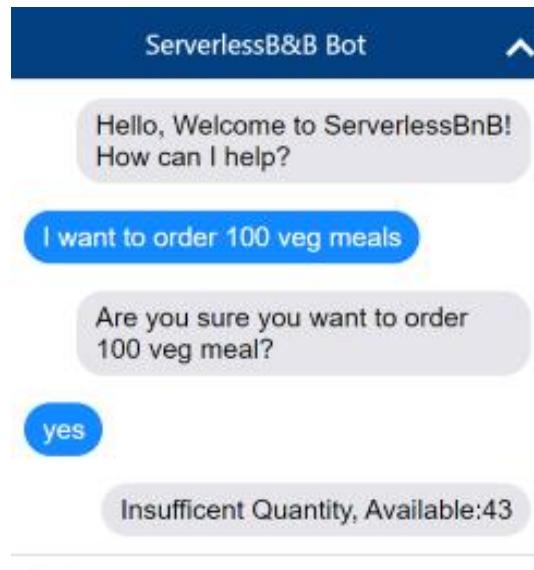

Figure 44: Logged in user booking for excessive quantity for meal order.

- Figure-45 displays response from chat bot when user denied the meal order confirmation. It can be seen that the bot prompts user to reenter the slot value if user provides invalid value for the slot.

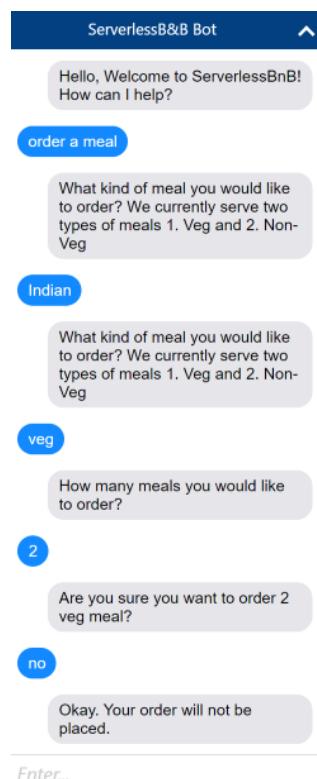

Figure 45: Chat bot response when user denied confirmation of meal order.

- Figure-46 displays user's interaction with chat bot for booking a tour. The bot response with Order ID if sufficient slots are available for a requested tour type otherwise it will respond with available slots for the requested tour types as displayed in Figure-47.

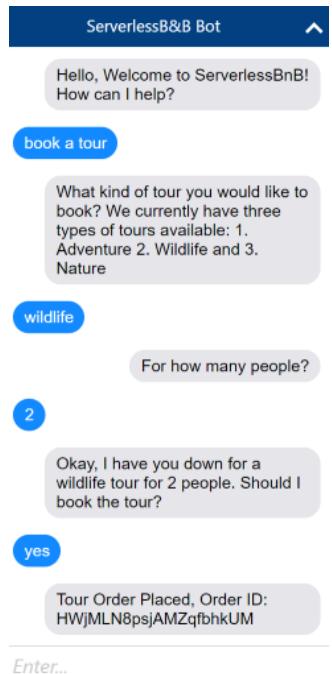

Figure 46: User and chat bot interaction during successful tour booking.

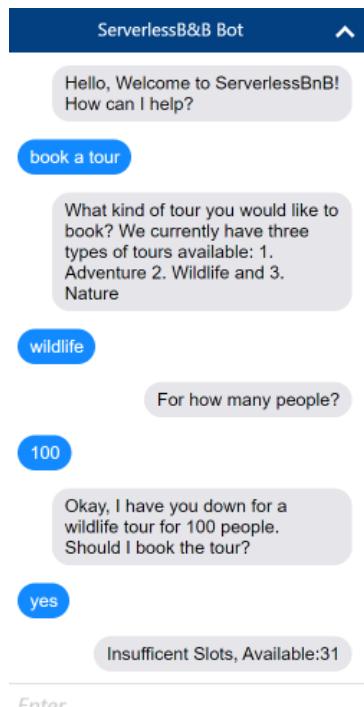

Figure 47: Chatbot response for excessive number of slots requested by user for tour.

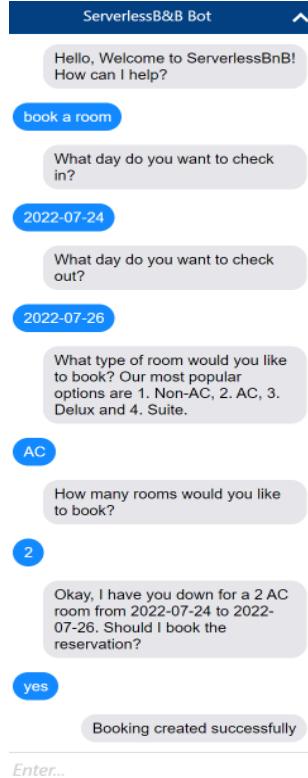

Figure 48: Chat bot booking rooms when user provides enough rooms for booking.

- Figure-48 displays interaction between user and the chat bot for room booking service. Chat bot responds with booking successful message when number of rooms requested by a user are available for user's check-in and check-out dates otherwise it displays rooms not available message as displayed in Figure-49.

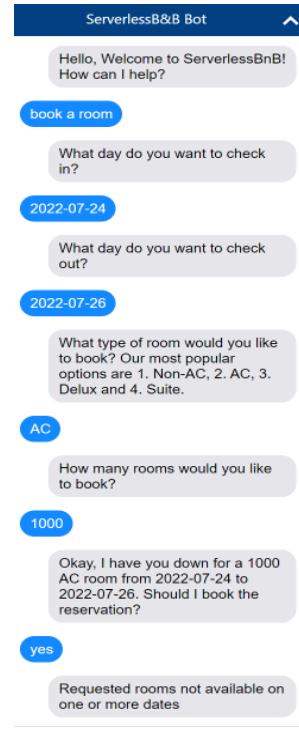

Figure 49: Chat bot response when the user requests excessive quantity of rooms during the booking.

Pseudo Code

Site Navigation

1. User provides utterance to chat bot; for example: “Navigate me to registration page”.
2. Based on the utterance the chat bot calls Navigation intent and passes the intent details to the ServerlessBnBLex lambda.
3. The lambda function retrieved intent details from the event and calls navigation method if the intent name matches.
4. The navigation method maps webpage with its URL using get_navigation_link() method and return the response to the user along with requested navigation URL.

Room Availability

1. User provides utterance to chat bot; for example: “I want to check room availability”.
2. Based on the utterance the chat bot calls RoomAvailability intent, the intent prompts user to provide slot values required for the fulfilment of the intent and passes the intent details to the triggered ServerlessBnBLex lambda.
3. The lambda function then retrieves intent details from the event and calls get_available_rooms() method.
4. The get_available_rooms() method gets the slot values such as check-in date and check-out date from the intent details.
5. Preprocesses the date values and makes a POST request to the API Endpoint that checks room availability.
6. If rooms are available between the provided dates, then the response is return to the user through lex and it contains available rooms of all types for those dates.
7. Otherwise, the lambda function return no rooms available message to the lex to display it to the user.

Order Meal

1. User provides utterance to chat bot; for example: “I want to order a meal”.
2. Based on the utterance the chat bot calls OrderMeal intent, the intent prompts user to provide slot values required for the fulfilment of the intent and passes the intent details to the triggered ServelessBnBLex lambda.
3. The lambda function retrieves session attributes of the logged in user from the intent details and if the session attribute is present then processed further, otherwise it sends a response to the user through lex asking him to login to use calling any booking service.
4. The lambda function then retrieves intent details from event and calls order_meal() function.
5. The order_meal() function gets the slot values from intent details such as Meal Type and Meal Quantity and makes a POST request to the API Endpoint which handles meal orders.
6. If enough quantity is available for the requested meal, then response is return by the lambda to user containing the order successful message and the order ID.
7. Otherwise, the lambda function returns Insufficient quantity available and available quantity of requested meal to the user through Lex.

Book Tour

1. User provides utterance to chat bot; for example: “I want to book a tour”.
2. Based on the utterance the chat bot calls BookTour intent, the intent prompts user to provide slot values required for the fulfilment of the intent and passes the intent details to the triggered ServelessBnBLex lambda.
3. The lambda function retrieves session attributes of the logged in user from the intent details and if the session attribute is present then processed further, otherwise it sends a response to the user through lex asking him to login to use calling any booking service.
4. The lambda function then retrieves intent details from event and calls book_tour() function.
5. The book_tour() function gets the slot values from intent details such as Tour Type and Number of People and makes a POST request to the API Endpoint which handles tour booking.
6. If enough slots are available for the requested tour type, then response is return by the lambda to user containing the Tour booking successful message and the order ID.
7. Otherwise, the lambda function returns Insufficient slots available and available quantity of requested tour to the user through Lex.

Book Room

1. User provides utterance to chat bot; for example: “I want to book a room”.
2. Based on the utterance the chat bot calls BookRoom intent, the intent prompts user to provide slot values required for the fulfilment of the intent and passes the intent details to the triggered ServelessBnBLex lambda.
3. The lambda function retrieves session attributes of the logged in user from the intent details and if the session attribute is present then processed further, otherwise it sends a response to the user through lex asking him to login to use calling any booking service.
4. The lambda function then retrieves intent details from event and calls book_room() function.
5. The book_room() function gets the slot values from intent details such as Room Type, Check-in date, Check-out date and Number of Rooms and makes a POST request to the API Endpoint which handles room booking.
6. If enough rooms are available for the requested room type between provided check-in and check-out date, then response is return by the lambda to user containing the Room booking successful message.
7. Otherwise, the lambda function returns Insufficient rooms available to the user through Lex.

Module 4: Message Passing Module

In this module, Hotel, Kitchen, Tour & Notification microservices communicate with each other. The communication is asynchronous i.e., the services interacting with each other need not be synchronously sending requests and responses as in the case of REST APIs, rather we make use of **Google Pub/Sub** topics which transfer data from publishers to subscribers, with latencies of order of 100 milliseconds [4]. Pub/Sub messaging enables the use of event driven architectures which are horizontally scalable.

In our Serverless B&B we have used **Google Cloud Functions & Google Pub/Sub** to enable service to service communication among microservices. We have also used **Firebase Cloud Messaging** to enable service to user communication.

Following scenarios have been considered:

1. Meal Order (Kitchen):

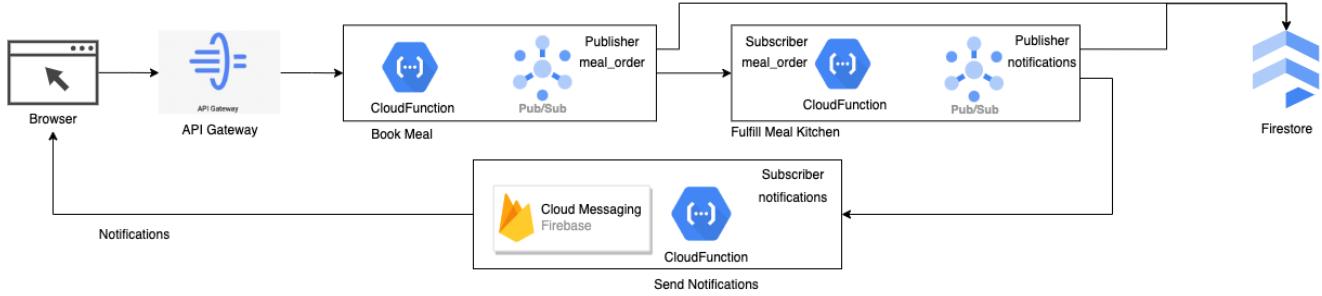

Figure 50: Flow chart for Meal Booking using Google Pub/Sub.

Customer places a meal order from the frontend. Meal Order is received as a HTTP POST request to API gateway which executes a cloud function “book-meal”. This cloud function acts as a hotel service which creates a meal order in database and communicates the order details through a pub/sub topic “meal_order”. A message published on “meal_order” topic triggers a new cloud function “fulfill-meal-kitchen”. This cloud function acts as kitchen service which receives order details, fulfills that order in the database, creates invoice for that order in database and publish a notification message to a pub/sub topic “notifications”. A message published on “notifications” topic triggers a new cloud function “send-notification”. This cloud function acts a notification service which receives a notification message and extracts the user details from it. Then it retrieves the corresponding token for that user from firestore and sends an order fulfillment notification to the frontend app using firebase cloud messaging.

Pub/Sub Topics:

a. meal_order

Subscription: gcf-fulfill-meal-kitchen-us-central1-meal_order

This topic is used for service-to-service communication between hotel and kitchen service. It receives food order from “book-meal” cloud function and triggers a “fulfill-meal-kitchen” cloud function.

The screenshot shows the Google Cloud Pub/Sub interface for the 'meal_order' topic. The left sidebar has 'Topics' selected. The main area shows the topic name 'meal_order' with the URL 'projects/serverlessbnb-354422/topics/meal_order'. Below it are tabs for 'SUBSCRIPTIONS', 'SNAPSHOTS', 'MESSAGES', 'METRICS', and 'DETAILS'. A note says 'Only subscriptions attached to this topic are displayed. A subscription captures the stream of messages published to a given topic. You can also stream messages to BigQuery or Cloud Storage by creating a subscription from a Cloud Dataflow job.' A 'CREATE SUBSCRIPTION' button is available. A table lists one subscription: 'Subscription ID' is 'gcf-fulfill-meal-kitchen-us-central1-meal_order', 'Subscription name' is 'projects/serverlessbnb-354422/subscriptions/gcf-fulfill-meal-kitchen-us-central1-meal_order', and 'Project' is 'serverlessbnb-354422'. A 'Filter' button is also present.

Figure 51: "meal_order" pub/sub topic created for meal order.

b. Notifications

Subscription: gcf-send-notifications-us-central1-notifications

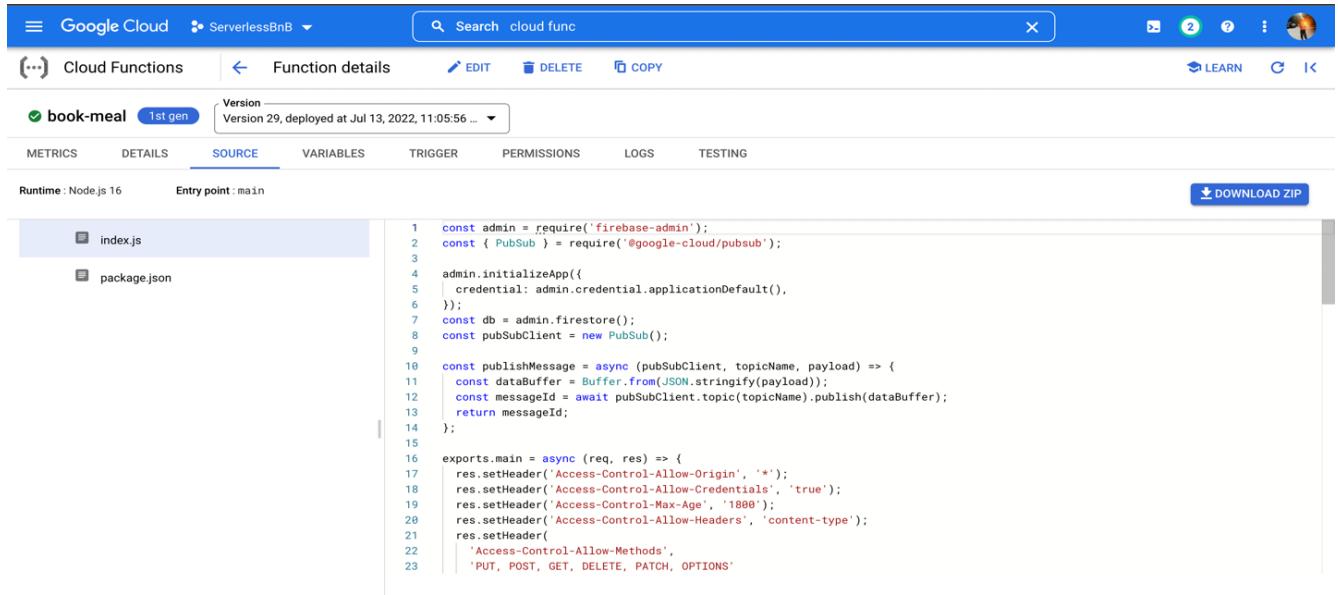

This topic is used for service-to-service communication between kitchen and notification service. It receives notification message from “fulfill-meal-kitchen” cloud function and triggers a “send-notifications” cloud function.

The screenshot shows the Google Cloud Pub/Sub interface for the 'notifications' topic. The left sidebar has 'Topics' selected. The main area shows the topic name 'notifications' with the URL 'projects/serverlessbnb-354422/topics/notifications'. Below it are tabs for 'SUBSCRIPTIONS', 'SNAPSHOTS', 'MESSAGES', 'METRICS', and 'DETAILS'. A note says 'Only subscriptions attached to this topic are displayed. A subscription captures the stream of messages published to a given topic. You can also stream messages to BigQuery or Cloud Storage by creating a subscription from a Cloud Dataflow job.' A 'CREATE SUBSCRIPTION' button is available. A table lists one subscription: 'Subscription ID' is 'gcf-send-notifications-us-central1-notifications', 'Subscription name' is 'projects/serverlessbnb-354422/subscriptions/gcf-send-notifications-us-central1-notifications', and 'Project' is 'serverlessbnb-354422'. A 'Filter' button is also present.

Figure 52: "notifications" pub/sub topic created for sending notifications.

Cloud Functions:

a. book-meal

The screenshot shows the Google Cloud Platform interface for a Cloud Function named "book-meal". The function is deployed to the "ServerlessBnB" project. The "SOURCE" tab is selected, displaying the code for index.js and package.json.

```

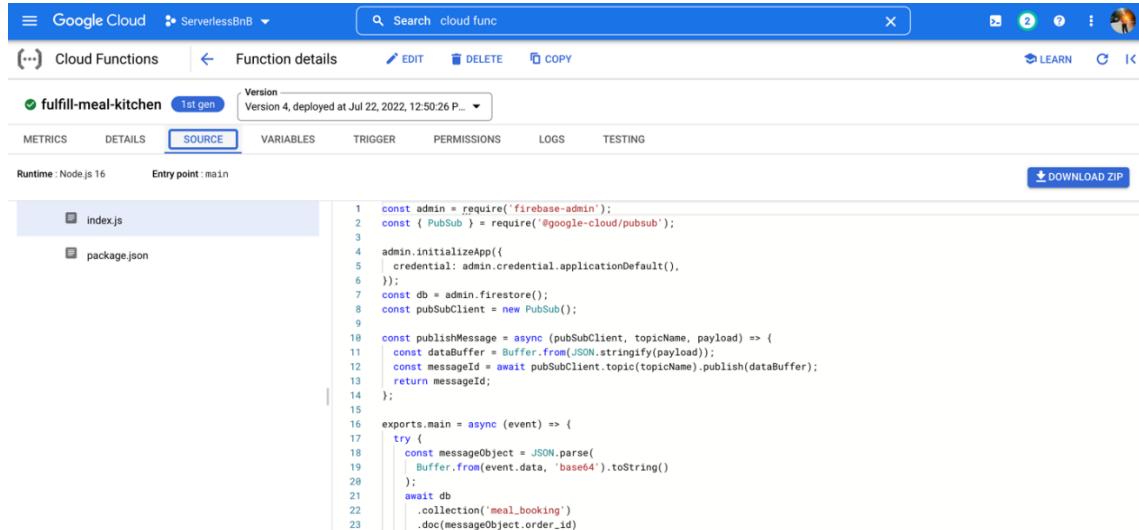

1  const admin = require('firebase-admin');
2  const { PubSub } = require('@google-cloud/pubsub');
3
4  admin.initializeApp({
5    credential: admin.credential.applicationDefault(),
6  });
7  const db = admin.firestore();
8  const pubSubClient = new PubSub();
9
10 const publishMessage = async (pubSubClient, topicName, payload) => {
11   const dataBuffer = Buffer.from(JSON.stringify(payload));
12   const messageId = await pubSubClient.topic(topicName).publish(dataBuffer);
13   return messageId;
14 };
15
16 exports.main = async (req, res) => {
17   res.setHeader('Access-Control-Allow-Origin', '*');
18   res.setHeader('Access-Control-Allow-Credentials', 'true');
19   res.setHeader('Access-Control-Max-Age', '1800');
20   res.setHeader('Access-Control-Allow-Headers', 'content-type');
21   res.setHeader(
22     'Access-Control-Allow-Methods',
23     'PUT, POST, GET, DELETE, PATCH, OPTIONS'
  
```

Figure 53: "book-meal" cloud function created to receive meal orders.

Pseudo Code:

- receives meal order details from frontend
- checks availability of meal type for current day.
- If available, creates a meal order in database and sends confirmation; If availability is not enough; it sends an error message back.
- If the order is created, it publishes a message with order details to “meal_order” pub sub topic. A message published to “meal_order” topic triggers “fulfill-meal-kitchen” cloud function.

b. fulfill-meal-kitchen

The screenshot shows the Google Cloud Platform interface for a Cloud Function named "fulfill-meal-kitchen". The function is deployed to the "ServerlessBnB" project. The "SOURCE" tab is selected, displaying the code for index.js and package.json.

```

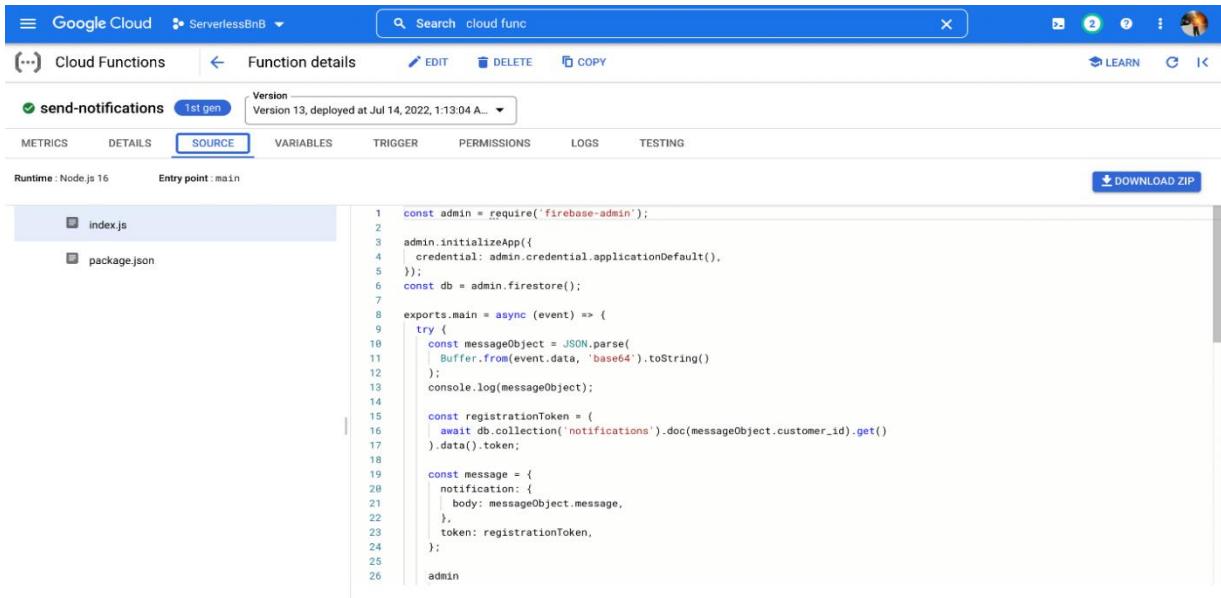

1  const admin = require('firebase-admin');
2  const { PubSub } = require('@google-cloud/pubsub');
3
4  admin.initializeApp({
5    credential: admin.credential.applicationDefault(),
6  });
7  const db = admin.firestore();
8  const pubSubClient = new PubSub();
9
10 const publishMessage = async (pubSubClient, topicName, payload) => {
11   const dataBuffer = Buffer.from(JSON.stringify(payload));
12   const messageId = await pubSubClient.topic(topicName).publish(dataBuffer);
13   return messageId;
14 };
15
16 exports.main = async (event) => {
17   try {
18     const messageObject = JSON.parse(
19       Buffer.from(event.data, 'base64').toString()
20     );
21     await db
22       .collection('meal_booking')
23       .doc(messageObject.order_id)
  
```

Figure 54: "fulfill-meal-kitchen" cloud function created to fulfill orders.

Pseudo Code:

- receives meal order details from “meal_order” topic.
- Changes the status of order from “Placed” to “Delivered” status.
- Creates an invoice for that meal order.
- Publishes a notification message to “notifications” topic which triggers a cloud function “send-notification”

c. send-notifications

```

1  const admin = require('firebase-admin');
2
3  admin.initializeApp({
4    credential: admin.credential.applicationDefault(),
5  });
6  const db = admin.firestore();
7
8  exports.main = async (event) => {
9    try {
10      const messageObject = JSON.parse(
11        Buffer.from(event.data, 'base64').toString()
12      );
13      console.log(messageObject);
14
15      const registrationToken = (
16        await db.collection('notifications').doc(messageObject.customer_id).get()
17      ).data().token;
18
19      const message = {
20        notification: {
21          body: messageObject.message,
22        },
23        token: registrationToken,
24      };
25
26      admin

```

Figure 55: "send-notifications" cloud function created to send notifications to frontend.

Pseudo Code:

- receives notification details from “notification” pub sub topic.
- Retrieves customer id from the message and then retrieves token for the corresponding customer.
- Transmits an order confirmation message to frontend using firebase cloud messaging.

2. Tour Order (Tour Operator):

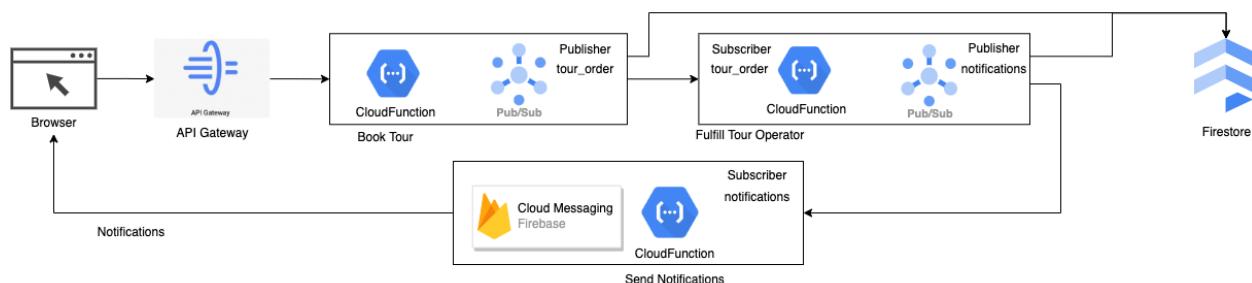

Figure 56: Flow chart for tour booking using Google Pub/Sub.

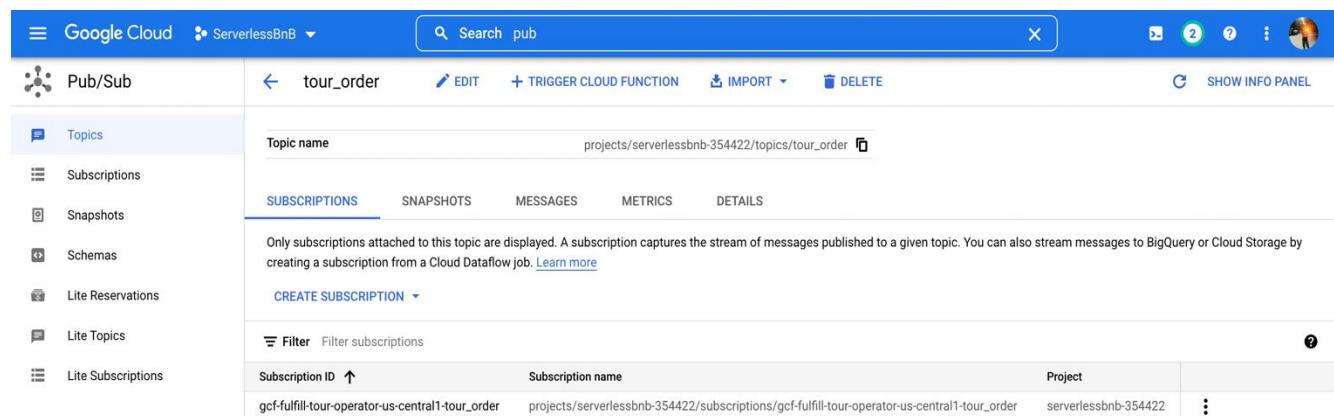

Customer places a tour order from the frontend. Tour Order is received as a HTTP POST request to API gateway which executes a cloud function “book-tour”. This cloud function acts as a hotel service which creates a tour order in database and communicates the order details through a pub/sub topic “tour_order”. A message published on “tour_order” topic triggers a new cloud function “fulfill-tour-operator”. This cloud function acts as tour service which receives order details, fulfills that order in the database, creates invoice for that order in database and publishes a notification message to a pub/sub topic “notifications”. A message published on “notifications” topic triggers a new cloud function “send-notification”. This cloud function acts a notification service which receives a notification message and extracts the user details from it. Then it retrieves the corresponding token for that user from firestore and sends an order fulfillment notification to the frontend app using firebase cloud messaging.

Pub/Sub Topics:

a. tour_order

Subscription: gcf-fulfill-tour-operator-us-central1-tour_order

This topic is used for service-to-service communication between hotel and tour service. It receives tour order from “book-tour” cloud function and triggers a “fulfill-tour-operator” cloud function.

The screenshot shows the Google Cloud Pub/Sub interface. The top navigation bar includes 'Google Cloud' and 'ServerlessBnB'. The search bar contains 'Search pub'. The main header for the 'tour_order' topic includes 'EDIT', '+ TRIGGER CLOUD FUNCTION', 'IMPORT', 'DELETE', and a 'SHOW INFO PANEL' button. On the left, a sidebar lists 'Topics', 'Subscriptions', 'Schemas', 'Lite Reservations', 'Lite Topics', and 'Lite Subscriptions'. The 'Topics' section is selected. The main content area displays the 'tour_order' topic details, including its name and project path: 'projects/serverlessbnb-354422/topics/tour_order'. Below this, there are tabs for 'SUBSCRIPTIONS', 'SNAPSHOTS', 'MESSAGES', 'METRICS', and 'DETAILS'. A note states: 'Only subscriptions attached to this topic are displayed. A subscription captures the stream of messages published to a given topic. You can also stream messages to BigQuery or Cloud Storage by creating a subscription from a Cloud Dataflow job.' A 'CREATE SUBSCRIPTION' button is available. A 'Filter' dropdown is present. At the bottom, a table lists a single subscription: 'Subscription ID' (gcf-fulfill-tour-operator-us-central1-tour_order), 'Subscription name' (projects/serverlessbnb-354422/subscriptions/gcf-fulfill-tour-operator-us-central1-tour_order), 'Project' (serverlessbnb-354422), and a three-dot menu icon.

Figure 57: "tour_order" topic created to communicate tour orders.

c. notifications

Subscription: gcf-send-notifications-us-central1-notifications

This topic is used for service-to-service communication between tour and notification service. It receives notification message from “fulfill-tour-operator” cloud function and triggers a “send-notifications” cloud function.

The screenshot shows the Google Cloud Pub/Sub interface. On the left, there's a sidebar with options like Topics, Subscriptions, Snapshots, Schemas, Lite Reservations, Lite Topics, and Lite Subscriptions. The main area is titled 'notifications' under 'Topics'. It shows a single subscription named 'gcf-send-notifications-us-central1-notifications'. The interface includes tabs for SUBSCRIPTIONS, SNAPSHOTS, MESSAGES, METRICS, and DETAILS. A note at the top says: 'Only subscriptions attached to this topic are displayed. A subscription captures the stream of messages published to a given topic. You can also stream messages to BigQuery or Cloud Storage by creating a subscription from a Cloud Dataflow job. Learn more'.

Figure 58: "notifications" topic created for sending notifications.

Cloud Functions:

a. book-tour

The screenshot shows the Google Cloud Functions interface. The function is named 'book-tour' (1st gen). It has a single version deployed at Jul 13, 2022, 11:06:52 P... The interface includes tabs for METRICS, DETAILS, SOURCE (which is selected), VARIABLES, TRIGGER, PERMISSIONS, LOGS, and TESTING. The runtime is Node.js 16 and the entry point is main. The code editor shows the 'index.js' file with the following content:

```

1 const admin = require('firebase-admin');
2 const { PubSub } = require('@google-cloud/pubsub');
3
4 admin.initializeApp({
5   credential: admin.credential.applicationDefault(),
6 });
7 const db = admin.firestore();
8 const pubSubClient = new PubSub();
9
10 const publishMessage = async (pubSubClient, topicName, payload) => {
11   const dataBuffer = Buffer.from(JSON.stringify(payload));
12   const messageId = await pubSubClient.topic(topicName).publish(dataBuffer);
13   return messageId;
14 };
15
16 exports.main = async (req, res) => {
17   res.setHeader('Access-Control-Allow-Origin', '*');
18   res.setHeader('Access-Control-Allow-Credentials', 'true');
19   res.setHeader('Access-Control-Max-Age', '1800');
20   res.setHeader('Access-Control-Allow-Headers', 'content-type');
21   res.setHeader(
22     'Access-Control-Allow-Methods',
23     'PUT, POST, GET, DELETE, PATCH, OPTIONS'
24   );
25   try {
26     const ref = db

```

Figure 59: "book-tour" cloud function created to receive tour orders from user.

Pseudo Code:

- receives tour order details from frontend
- checks availability of tour type for current day.
- If available, creates a tour order in database and sends confirmation; If availability is not enough; it sends an error message back.
- If the order is created, it publishes a message with order details to “tour_order” pub sub topic. A message published to “tour_order” topic triggers “fulfill-tour-operator” cloud function.

b. fulfill-tour-operator

```

1 const admin = require('firebase-admin');
2 const { PubSub } = require('@google-cloud/pubsub');
3
4 admin.initializeApp({
5   credential: admin.credential.applicationDefault(),
6 });
7 const db = admin.firestore();
8 const pubSubClient = new PubSub();
9
10 const publishMessage = async (pubSubClient, topicName, payload) => {
11   const dataBuffer = Buffer.from(JSON.stringify(payload));
12   const messageId = await pubSubClient.topic(topicName).publish(dataBuffer);
13   return messageId;
14 };
15
16 exports.main = async (event) => {
17   try {
18     const messageObject = JSON.parse(
19       Buffer.from(event.data, 'base64').toString()
20     );
21     await db
22       .collection('tour_booking')
23       .doc(messageObject.order_id)
24       .update({ status: 'Delivered' });
25     const price = (
26       await db.collection('tours').doc(messageObject.tour_id.toString()).get()
27     ).data().price;
28     const notificationObject = {
29       customer_id: messageObject.customer_id,
30       tour_id: messageObject.tour_id,
31       booking_id: messageObject.order_id,
32       price: price,
33       status: 'Delivered',
34     };
35     const registrationToken = (
36       await db.collection('notifications').doc(messageObject.customer_id).get()
37     ).data().token;
38
39     const message = {
40       notification: {
41         body: messageObject.message,
42       },
43       token: registrationToken,
44     };
45
46     pubSubClient.publish(topicName, message);
47   } catch (error) {
48     console.error(error);
49   }
50 }

```

Figure 60: "fulfill-tour-operator" cloud function created to fulfill tour orders.

Pseudo Code:

- receives tour order details from “tour_order” topic.
- Changes the status of order from “Placed” to “Delivered” status.
- Creates an invoice for that tour order.
- Publishes a notification message to “notifications” topic which triggers a cloud function “send-notification”

c. send-notifications

```

1 const admin = require('firebase-admin');
2
3 admin.initializeApp({
4   credential: admin.credential.applicationDefault(),
5 });
6 const db = admin.firestore();
7
8 exports.main = async (event) => {
9   try {
10     const messageObject = JSON.parse(
11       Buffer.from(event.data, 'base64').toString()
12     );
13     console.log(messageObject);
14
15     const registrationToken = (
16       await db.collection('notifications').doc(messageObject.customer_id).get()
17     ).data().token;
18
19     const message = {
20       notification: {
21         body: messageObject.message,
22       },
23       token: registrationToken,
24     };
25
26     admin
27       .messaging()
28       .send(message);
29   } catch (error) {
30     console.error(error);
31   }
32 }

```

Figure 61: "send-notifications" cloud function created to send notifications to the frontend.

Pseudo Code:

- receives notification details from “notification” pub sub topic.
- Retrieves customer id from the message and then retrieves token for the corresponding customer.
- Transmits an order confirmation message to frontend using firebase cloud messaging.

Firebase Cloud Messaging:

This service is used for service to user communication. It transmits a message from “send-notifications” to a specific user token for frontend of the app. Frontend of the application is running a service worker which listens for any incoming notifications to the app.

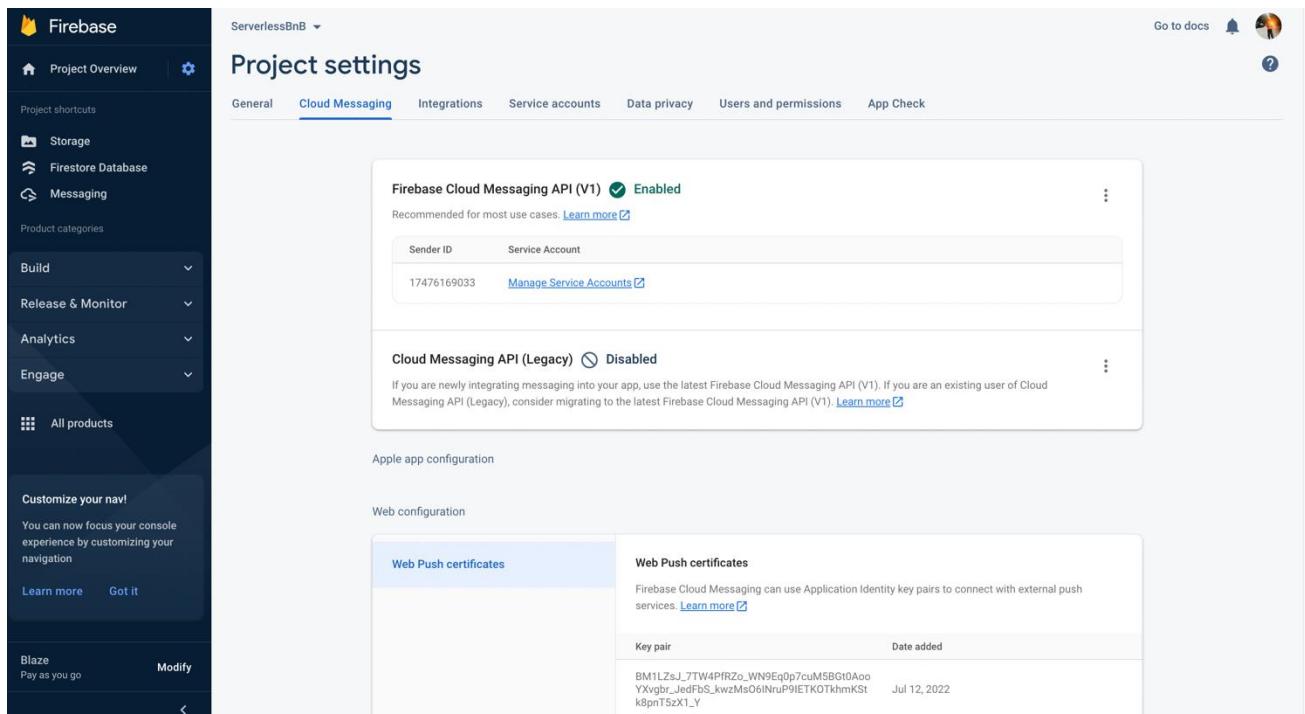

Figure 62: "Firebase cloud messaging" configuration to send notifications to the frontend.

Test Cases - Kitchen, Tour & Notification Service through Pub/Sub

1. Meal Order Insufficient Quantity

- a. User Places a Meal Order from the frontend. The Quantity selected on the order is more than the availability for that meal type on current day.

The screenshot shows the 'Book Meal' form with 'Meal Type' set to 'Veg' and 'Quantity' set to '200'. The 'Submit' button is visible. To the right, a 'Menu' table lists items: #1 Veg at 19 \$ and #2 Non-Veg at 29 \$. Below the form is a dark sidebar with the 'Serverless B&B' logo and navigation links: Rooms, Meals, Tours, Home, FAQ, and About.

#	Meal Type	Price / Meal
1	Veg	19 \$
2	Non-Veg	29 \$

Figure 63: Meal Order placed with insufficient quantity.

- b. Insufficient Quantity notification is sent to the user.

The screenshot shows the 'Book Meal' form with 'Meal Type' set to 'Veg' and 'Quantity' set to '1'. The 'Submit' button is visible. A message box displays 'Insufficient Quantity, Available:48'. To the right, a 'Menu' table lists items: #1 Veg at 19 \$ and #2 Non-Veg at 29 \$. Below the form is a dark sidebar with the 'Serverless B&B' logo and navigation links: Rooms, Meals, Tours, Home, FAQ, and About.

#	Meal Type	Price / Meal
1	Veg	19 \$
2	Non-Veg	29 \$

Figure 64: Insufficient quantity message sent to the user.

2. Meal Order Successful

- a. User Places a Meal Order from the frontend with valid quantity. A meal order is booked with status 'Placed'

The screenshot shows the application's main interface. At the top, there is a navigation bar with links for Rooms, Meals, Tours, Feedback, and Visualizations. A user's email, rahulkherajani20@gmail.com, is displayed along with a message: "Meal Order Placed, Order ID: RsUaIN1KU8VAbPHpN8b5". Below the navigation bar, there are two sections: "Book Meal" and "Menu". The "Book Meal" section contains fields for "Meal Type" (set to "Veg") and "Quantity" (set to "1"), with a "Submit" button. The "Menu" section displays a table of meal items:

#	Meal Type	Price / Meal
1	Veg	19 \$
2	Non-Veg	29 \$

At the bottom, there is a footer with links for Rooms, Meals, Tours, Home, FAQ, and About. A blue button labeled "ServerlessB&B Bot" with a dropdown arrow is also present.

Figure 65: Meal order placed with valid quantity

- b. Order is fulfilled through pub/sub triggered kitchen service and notification is sent back to frontend by notification service triggered through pub/sub.

This screenshot is similar to Figure 65 but shows the order has been fulfilled. The notification message at the top right now reads: "Meal Order Delivered & Invoice Generated, Order ID: RsUaIN1KU8VAbPHpN8b5". The rest of the interface, including the Book Meal form, menu table, and footer, remains the same.

Figure 66: Meal order fulfilled through pub/sub.

3. Tour Order Insufficient Quantity

- a. User Places a Tour Order from the frontend. The Quantity selected on the order is more than the availability for that meal type on current day.

The screenshot shows a web application interface for "Serverless B&B". At the top, there's a navigation bar with links for Rooms, Meals, Tours, Feedback, and Visualizations. A user session is shown as "rahulkherajani20@gmail.com". A modal window titled "Insufficient Slots, Available:17" is displayed.

Predict Tour

Stay duration:

Predict

Book Tour

Tour Type: Adventure

No. of People: 1

Submit

Prices

#	Tour Type	Price / Person
1	Adventure	79 \$
2	Wildlife	99 \$
3	Nature	89 \$

At the bottom, there's a footer with links for Rooms, Meals, Tours, Home, FAQ, and About, along with a "ServerlessB&B Bot" button.

Figure 67: Meal order placed with insufficient available quantity.

- b. Insufficient Quantity notification is sent to the user.

This screenshot is identical to Figure 67, showing the same interface and the "Insufficient Slots, Available:17" modal window.

Predict Tour

Stay duration:

Predict

Book Tour

Tour Type: Adventure

No. of People: 1

Submit

Prices

#	Tour Type	Price / Person
1	Adventure	79 \$
2	Wildlife	99 \$
3	Nature	89 \$

At the bottom, there's a footer with links for Rooms, Meals, Tours, Home, FAQ, and About, along with a "ServerlessB&B Bot" button.

Figure 68: Insufficient quantity notification sent to the user.

4. Tour Order Successful

- a. User Places a Tour Order from the frontend with valid quantity. A tour order is booked with status 'Placed'.

The screenshot shows a web browser window for main.d1gwq7lhjz8oz9.amplifyapp.com/tours. The page has a dark header with the 'Serverless B&B' logo and navigation links for Rooms, Meals, Tours, Feedback, and Visualizations. A sidebar on the right shows a list of tour types with their prices:

#	Tour Type	Price / Person
1	Adventure	79 \$
2	Wildlife	99 \$
3	Nature	89 \$

The main content area contains two forms: 'Predict Tour' and 'Book Tour'. The 'Book Tour' form includes dropdowns for 'Tour Type' (set to 'Adventure') and 'No. of People' (set to '1'), followed by a 'Submit' button. A success message 'Tour Order Placed, Order ID: d1Gy3HAcCxszrserUw' is displayed in a toast notification at the top right.

Figure 69: Tour order placed with valid quantity.

- b. Order is fulfilled through pub/sub triggered kitchen service and notification is sent back to frontend by notification service triggered through pub/sub.

This screenshot is identical to Figure 69, showing the same tour order placement process. The difference is in the toast notification, which now says 'Tour Order Delivered & Invoice Generated, Order ID: d1Gy3HAcCxszrserUw', indicating the order has been processed through a Pub/Sub architecture.

Figure 70: Tour order delivered using Pub/Sub.

Module 5: Machine Learning Module [8]

We have used Vertex AI service of GCP to implement whole ML module.

To identify the similarity of stay duration of customers and propose a tour package:

To implement this task, We have used VertexAI's AutoML service. More specifically, we used Tabular data classification model. Here we trained our model using predefined duration-package data. Then we deployed that model on Auto ML endpoint. Afterwards, using REST API we integrated those endpoints to the application.

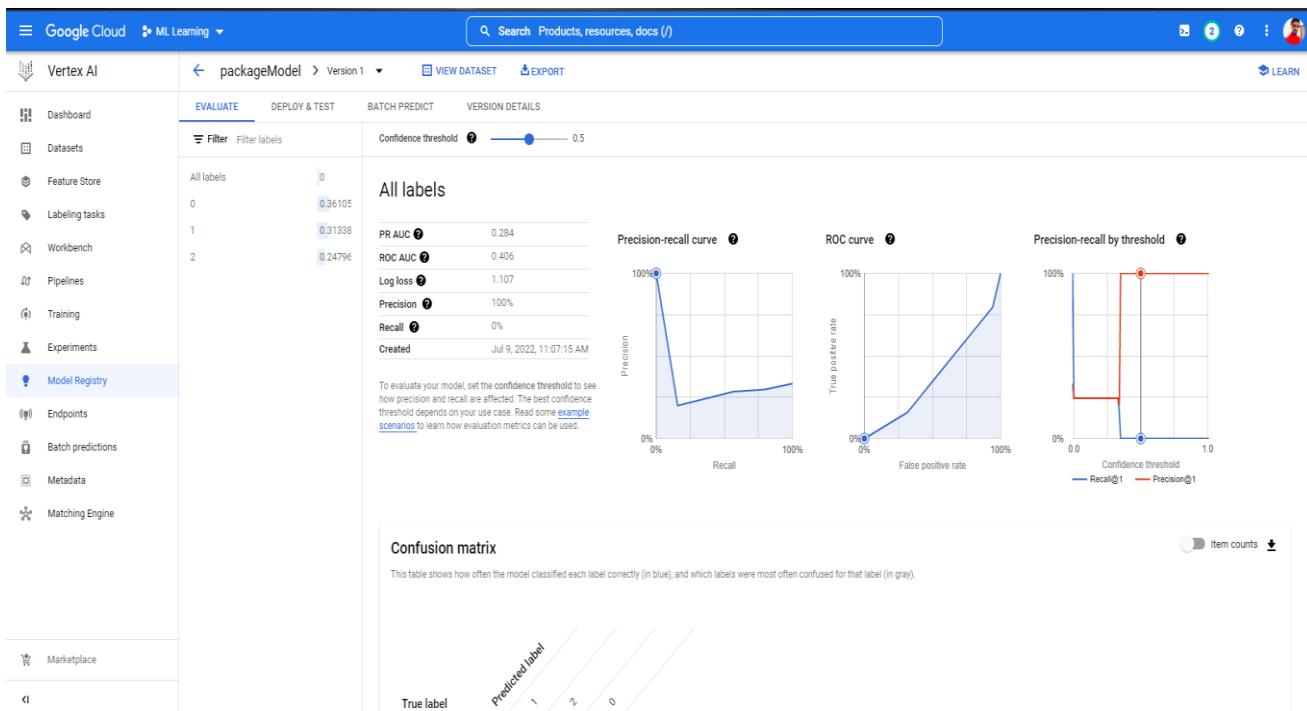

Figure 71: Trained model of package prediction.

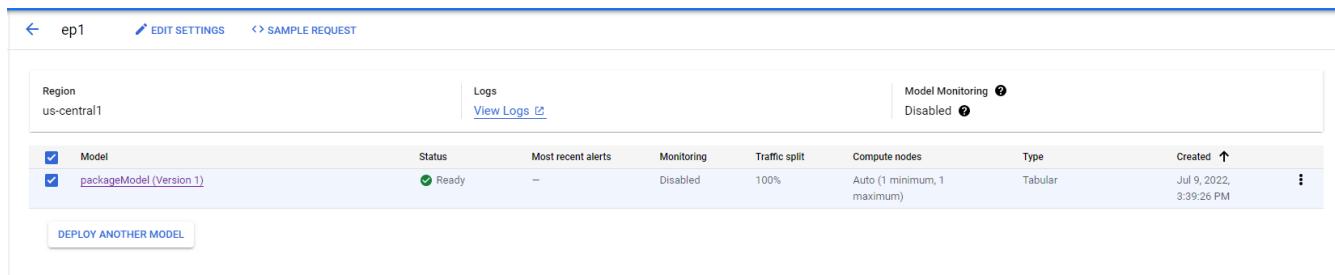

Figure 72: Model deployed on endpoint.

The screenshot shows a web application for tour booking. At the top, there's a navigation bar with links for Rooms, Meals, Tours, Feedback, and Visualizations. On the right, it shows the user's email (rahulkherajani20@gmail.com), Login Statistics, and Log Out options. The main content area has two sections: "Predict Tour" and "Book Tour".

Predict Tour Section:

- A text input field labeled "Stay duration" with the value "33".
- A large dark button labeled "Predict".
- A message below the button: "You should select \"WildLife\" type of tour!"

Book Tour Section:

- A dropdown menu labeled "Tour Type" set to "Adventure".
- A text input field labeled "No. of People" with the value "1".
- A large dark button labeled "Submit".

On the right side of the page, there's a sidebar with the title "Prices" and a table showing tour types and their prices per person:

#	Tour Type	Price / Person
1	Adventure	79 \$
2	Wildlife	99 \$
3	Nature	89 \$

At the bottom right of the sidebar, it says "ServerlessB&B Bot".

Figure 73: Predict Tour testcase.

On a tour booking page, there is a section named predict tour, where you can predict a tour based on your stay duration. When I entered 33 as my stay duration, the system suggests me to go for Wildlife type of tour.

```
const Bearer_token = "ya29.a0AVAvy1v37430nieof7tqrTcxVxxts53vI_F_r8XBqncG46q8p4hrDyv10P0tycScbA";
const ProjectId = "ml-learning-352715";
const EndpointId = "8254772661528297472";

const predictPackage = async (duration, Bearer_token, ProjectId, EndpointId) => {
  const res = await axios.post(`https://us-central1-aiplatform.googleapis.com/v1/projects/${ProjectId}/locations/us-central1/endpoints/${EndpointId}:predict`, {
    "instances": { "duration": duration },
    "headers: {
      'Authorization': 'Bearer ' + Bearer_token,
      'content-type': 'application/json'
    }
  });
  const maxi = await Math.max(...res.data.predictions[0].scores);
  const ind = await res.data.predictions[0].scores.indexOf(maxi);
  console.log(res.data.predictions[0].classes[ind]);
  return res.data.predictions[0].classes[ind];
};
```

Figure 74: Code snippet to predict a package.

To identify the polarity of customer feedback and to add appropriate score:

To implement this task, we have used VertexAI's AutoML service. More specifically, we used Sentiment Analysis model. Here we trained our model using predefined Feed-back dataset. Which has 30 feedbacks (15 for each type of sentiment). Then we deployed that model on Auto ML endpoint. Afterwards, using REST API we integrated those endpoints to the application.

The screenshot shows the Vertex AI Evaluate interface for a model named "PolarityCheck". The left sidebar includes options like Dashboard, Datasets, Feature Store, Labeling tasks, Workbench, Pipelines, Training, Experiments, Model Registry, Endpoints, Batch predictions, Metadata, Matching Engine, and Marketplace. The main content area displays "All sentiment scores" with a table showing precision (100%), recall (100%), and counts for 0 and 1. It also shows a "Confusion matrix" table where both rows and columns for 0 and 1 are labeled "100%".

Figure 75: Trained model for sentiment analysis.

The screenshot shows the Vertex AI Endpoints interface for a model named "csci5410". The left sidebar includes options like Dashboard, Datasets, Feature Store, Labeling tasks, Workbench, Pipelines, Training, Experiments, Model Registry, and Endpoints. The main content area shows the "Region" as "us-central1", a "Logs" section with a "View Logs" link, and a table for the "Model" named "PolarityCheck (Version 1)". The table includes columns for Status (Ready), Most recent alerts (none), Monitoring (Disabled), Traffic split (100%), Compute nodes (Auto), Type (Sentiment analysis), and Created (Jul 18, 2022, 7:51:48 AM). Below the table is a "DEPLOY ANOTHER MODEL" button and a chart titled "Predictions/second" which shows no data available for the selected time frame.

Figure 76: Endpoint for sentiment Analysis model.

The screenshot shows the Google Cloud Functions interface. The left sidebar includes Cloud Functions, Functions, CREATE FUNCTION, REFRESH, and RELEASE NOTES. The main content area lists two functions: "feedback_analysis" and "storeFeedbackWithRate", both created by "1st gen". The table includes columns for Environment (radio buttons for "Environment" and "1st gen"), Name (sorted by "Name ↑"), Region (us-central1), Trigger (HTTP), Runtime (Python 3.9), Memory allocated (256 MB), Executed function (getFeedbackPercent and store_text_ratings), Last deployed (Jul 18, 2022, 7:35:28 AM and Jul 17, 2022, 4:26:08 PM), Authentication (checkboxes for "No authentication" and "Cloud Identity"), and Actions (three-dot menu icons).

Figure 77: Cloud Functions for sentiment Analysis.

The screenshot shows the Google Cloud Firestore interface. On the left, the sidebar has sections for Database (Data, Indexes, Import/Export, Time-to-live (TTL), Security Rules), Insights (Usage, Key Visualizer), and Release Notes. The main area shows a collection named 'user_feedbacks' under the 'Root' node. A document named 'z8IDMcZt2Qplv0fjL9i' is selected, showing its fields: 'feedback' (value: 'Nice great love it') and 'score' (value: '1'). Other documents in the list include 'fRIHJeCXHtj5UeDtjDD3', 'kTxEgjZqGcWlJWXAXWhW', 'maQdD6LDhwAOkgAEMjK2', 'n3tmIDzACOs20zwNe4U9', 'tqYh8RaMuUVXF5reEbue', 'twFa2eH1qu1CD7EVtgt', 'vG3e72PB6agjvVt5wMMi', and 'y1aA3TRHGptxOUA0gpAD'.

Figure 78: Firestore for sentiment analysis.

```
const Bearer_token = "ya29.a0ARrdaM_QRFr-K4bTHU6Ymanqq-wxPs1R91U_Im_HNIjYkDE80L2k3g5HdUo0Q4oXc";
const ProjectId = "ml-learning-352715";
const EndpointId = "5946255640035852288";

const getSentiment = async (sentence, Bearer_token, ProjectId, EndpointId) => {
  const res = await axios.post(`https://us-central1-aiplatform.googleapis.com/ui/projects/${ProjectId}/locations/us-central1/endpoints/${EndpointId}:predict`, { "instances": { "mimeType": "text/plain", "content": sentence } }, {
    headers: {
      'Authorization': `Bearer ${Bearer_token}`,
      'content-type': 'application/json'
    }
  });
  console.log(res.data.predictions[0].sentiment);
  return (res.data.predictions[0].sentiment);
};
```

Figure 79: Code snippet to predict sentiment.

The screenshot shows a web application interface. At the top, there is a navigation bar with a logo, 'Rooms', 'Meals', 'Tours', 'Feedback', 'Visualizations', and user information ('rahulkherajani20@gmail.com', 'Login Statistics', 'Log Out'). Below the navigation bar, there are two main sections: 'Please Provide Your Feedback' (with a text input field labeled 'Feedback' and a 'Submit' button) and 'Reviews on ServerlessB&B' (showing statistics: 'Positive Reviews: 42.857142857142854 %' and 'Negative Reviews: 57.142857142857146%'). At the bottom, there is a footer with a logo, 'Rooms', 'Meals', 'Tours', 'Home', 'FAQ', and 'About'. A blue bar at the very bottom contains the text 'ServerlessB&B Bot' and a dropdown arrow icon.

Figure 80: Feedback page.

Here, user provides feedback, and it will be stored in a firestore. Then we analyze those feedbacks and provide the output that how much portion is positive.

Module 6: Web Application building and hosting

As the program's user-facing front-end module, this module serves as the application. Utilizing the ReactJS library, this module was created. We can design reusable components with ReactJS, which enables us to develop interactive applications. It has a large user base, is adaptable, and is simple to manage. Python and NodeJS are used to build and deploy modules in the backend's micro-services architecture. Amplify is used to host the front-end application.

Module 7: Other Essential Modules – Testing, Report Generation, and Visualizations

Room Booking

To book a room, user can navigate to “Rooms” section from the navbar. On the book room page, user can see various types of Rooms available for stay along with their respective price. Mainly, they include Non-AC rooms, AC rooms, Deluxe rooms, and Suites. Figure 81 shows the web screen for booking rooms.

#	Room Type	Price / Night
1	Non-AC	99 \$
2	AC	149 \$
3	Deluxe	199 \$
4	Suite	249 \$

Figure 81: Room booking screen.

Test Cases

Booking room – rooms not available

When user clicks on “Check Availability” button after filling in the required details, /get-available-rooms API will be called using the provided inputs. An alert box with an appropriate message will be displayed with the availability of rooms. Figure 82 shows the alert message when there are no rooms available for the selected dates.

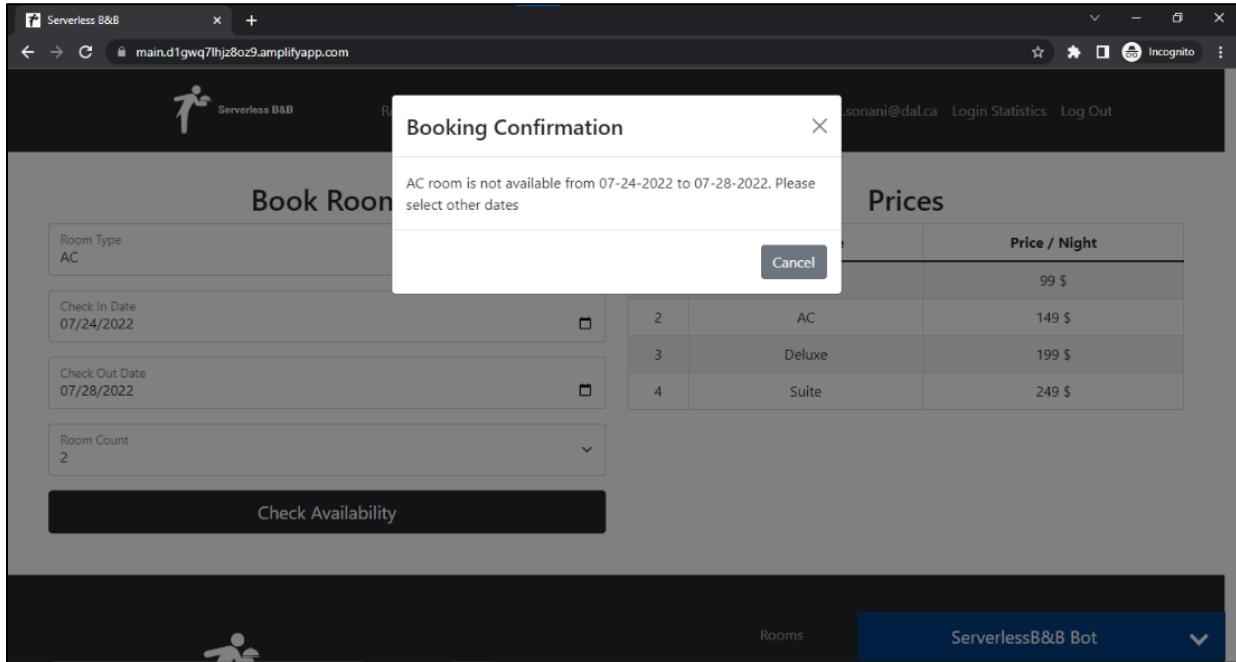

Figure 82: Rooms not available alert box.

Booking room – rooms are available

If rooms are available for the selected date, the system asks for confirmation from the user. Figure 83 shows an alert box asking for confirmation before making the final booking.

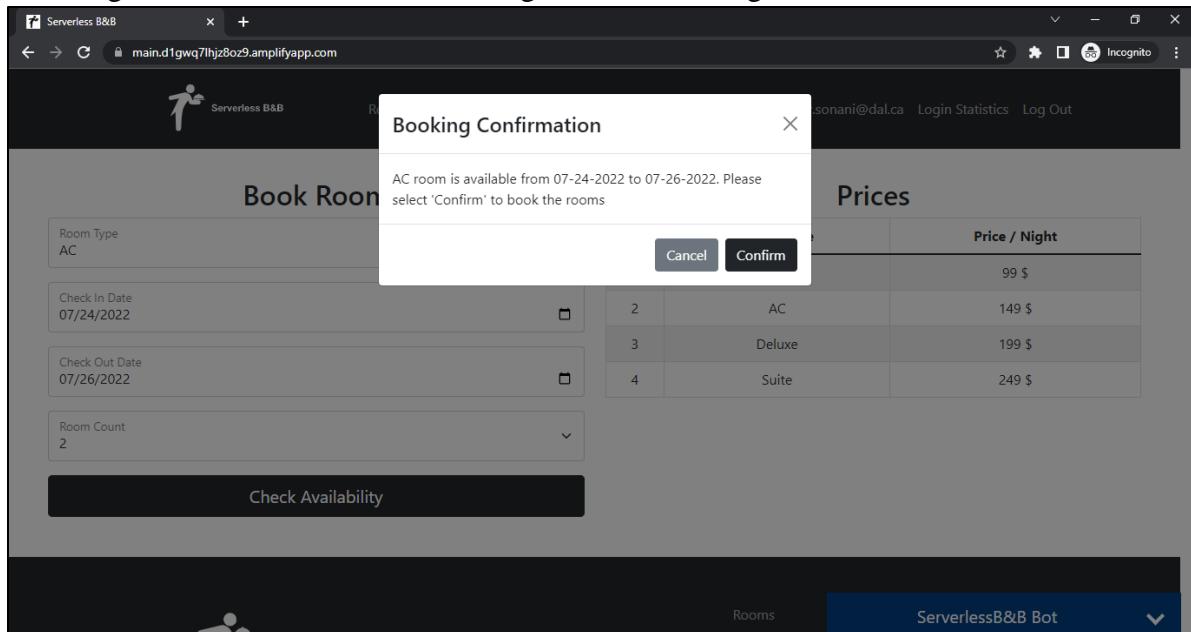

Figure 83: Confirmation alert box.

Once the user confirms the booking, a notification has been pushed and the same can be seen on the home page. Moreover, an invoice for the booking has also been generated. Figure 84 illustrates the logs of notifications and invoices.

Figure 84: Notifications and Invoices.

To check the availability of rooms in the database, there is a POST API that accepts start and end date and provides the response with all the available rooms with their count between selected dates. Figure 85 shows the end point configured in the API Gateway's config.yaml file.

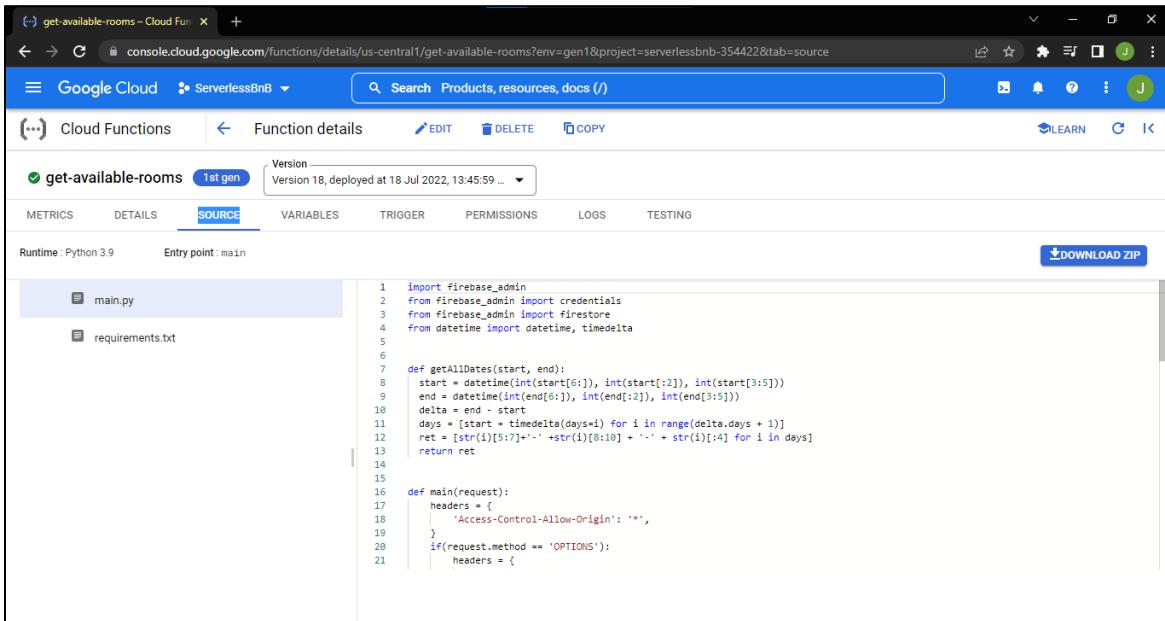

```

290 /get-available-rooms:
291   post:
292     description: "get-available-rooms"
293     operationId: "get-available-rooms"

21         headers = {

```

Figure 86: Cloud function "get-available-rooms".

The get-available-rooms cloud function fetches the data from a firebase collection. A collection named "room_availability" is maintained that contains one document per date. These documents store count for all types of the rooms. Figure 87 shows the described firebase collection.

Date	Room Type	Count
07-24-2022	count_AC	913
07-24-2022	count_Deluxe	4
07-24-2022	count_NonAC	5
07-24-2022	count_Suite	90
07-25-2022	count_AC	913
07-25-2022	count_Deluxe	4
07-25-2022	count_NonAC	5
07-25-2022	count_Suite	90
07-26-2022	count_AC	913
07-26-2022	count_Deluxe	4
07-26-2022	count_NonAC	5
07-26-2022	count_Suite	90

Figure 87: Firebase collection "room_availability".

To book rooms, book-rooms POST API will be called. This API is configured in the GCP API gateway in the configuration file as it can be seen in the Figure 88.

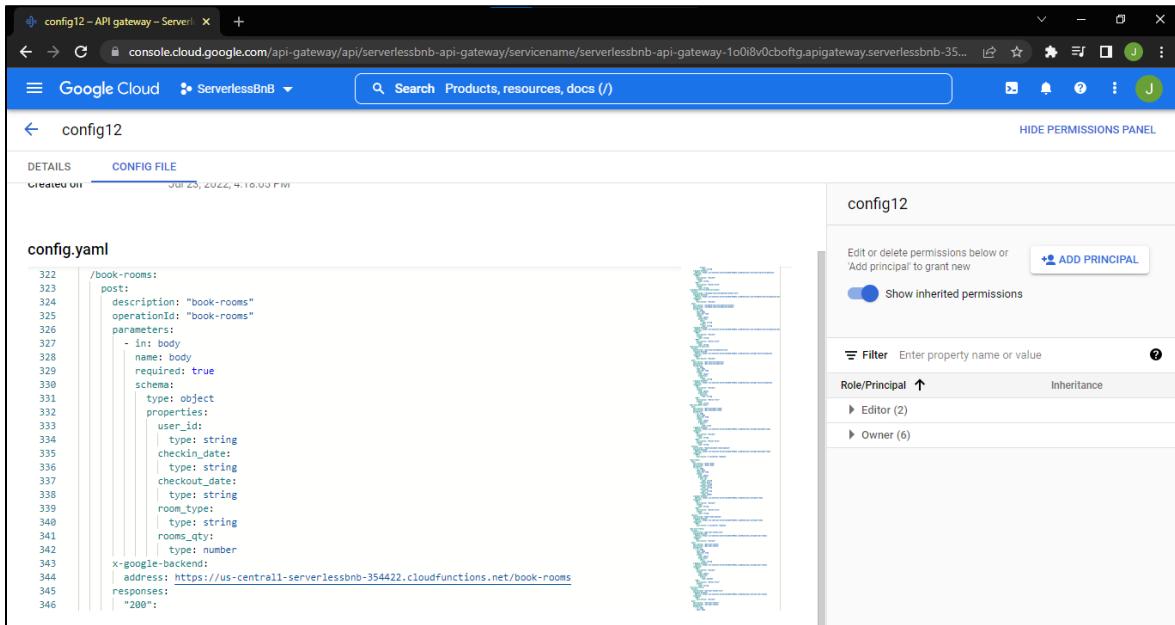

Figure 88: Book-rooms configuration for API gateway.

This API invokes the cloud function “book-rooms” that will first check for the availability of the rooms. If rooms are available on all the requested dates, it will create a booking and store in in “room_booking” firebase collection. Figure 89 and Figure 90 show the cloud function “book_rooms” and the firebase collection “room_booking” respectively.

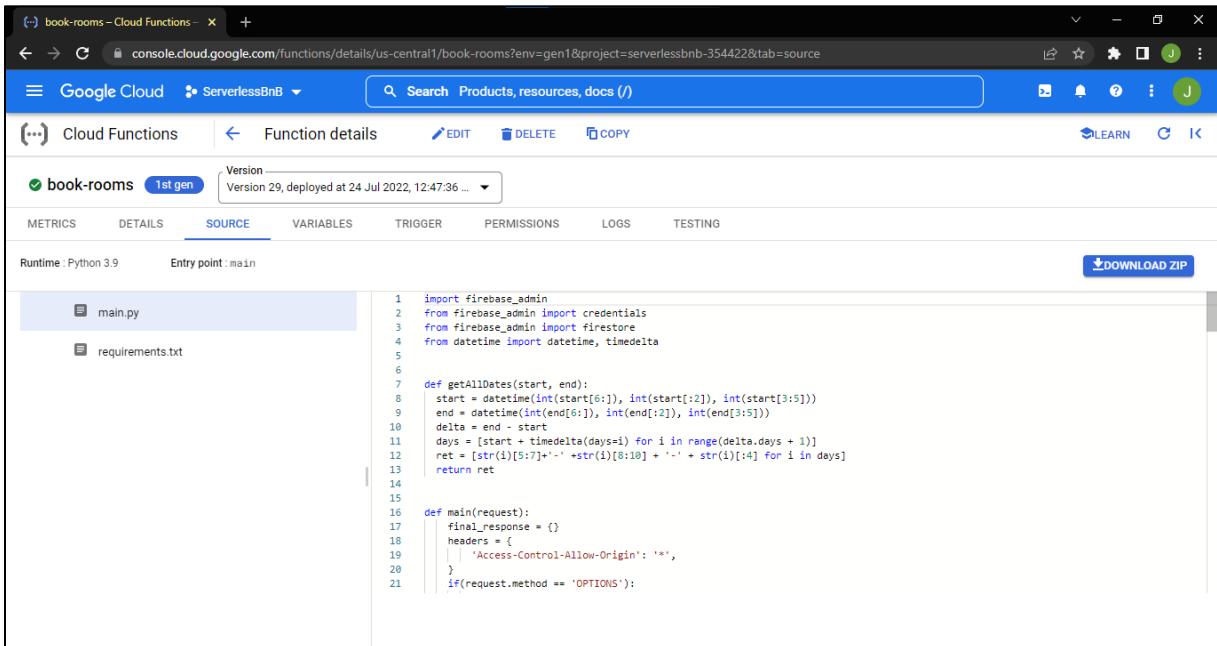

Figure 89: Cloud function “book-rooms”.

The screenshot shows the Firebase Cloud Firestore interface. On the left, the navigation sidebar is visible with sections like Project Overview, Product shortcuts, and Firestore Database selected. Under Firestore Database, there are collections: caesar_keys, meal_availability, meal_booking, meals, notifications, room_availability, room_booking (which is selected and expanded), rooms, security-questions, and tour_availability. The main area displays the 'room_booking' collection with documents listed on the right. One document is selected, showing its details: jay.sonani@dal.ca, checkin_date: '07-24-2022', checkout_date: '07-25-2022', and rooms_qty: 3. Other documents listed include agharkar.mugdha@gmail.com, jay.hello@dal.ca, jay.patel@dal.ca, mg425404@dal.ca, mugdha.agharkar@gmail.com, pankti.vyas21@gmail.com, rahulkherajani20@gmail.com, rh346685@dal.ca, and ruchi.shinde97@gmail.com.

Figure 90: Firebase collection “room_booking”.

Pseudo Code

- User navigates to book room section
- User fills the form
- User hits the submit button
- Room availability is checked
- If rooms are not available, appropriate message has been shown
- If rooms are available, a confirmation is asked
- Once the user confirms, rooms are booked
- Notification and invoice are generated for the booking

Report Generation:

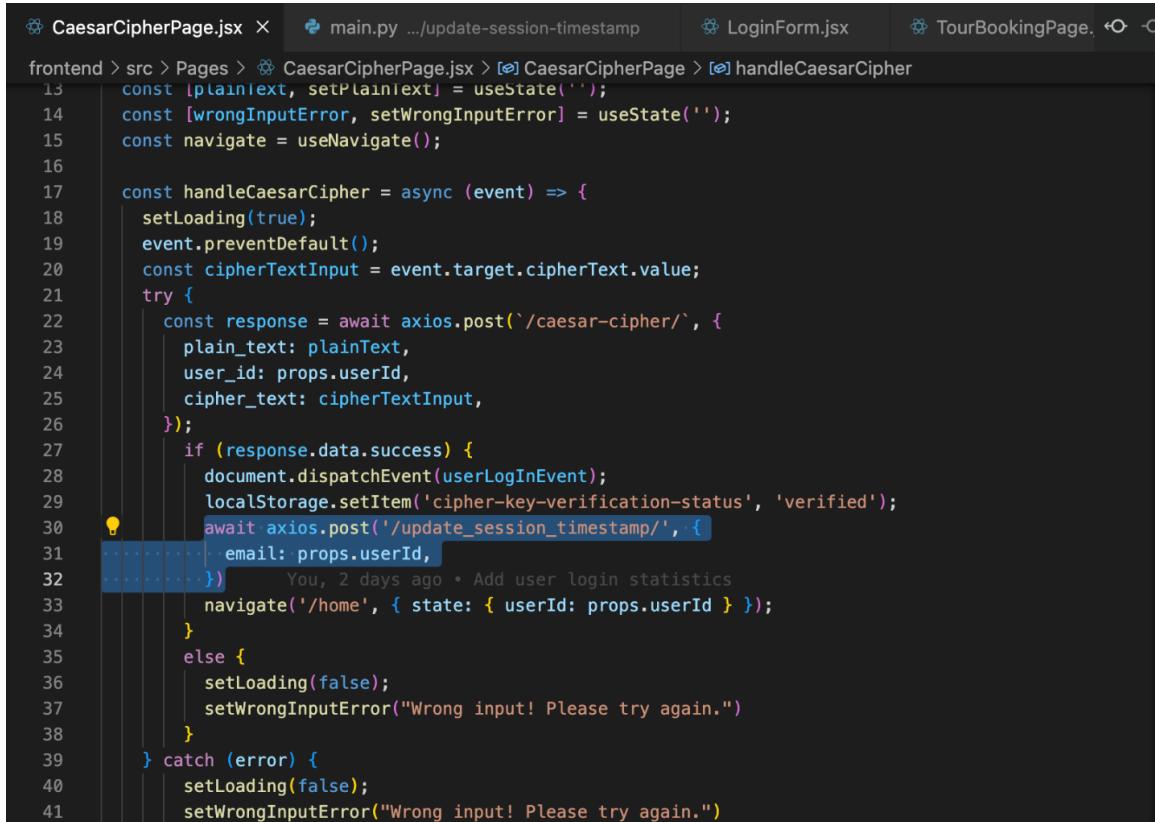

In this module, the previous login statistics of the user are displayed to them. The implementation for this involved triggering two cloud functions – one POST API (*update_session_timestamp*) to store the timestamp of login and logout in the Firestore collection (*user_login_stats*), and one GET API (*get_user_session_stats*) to get all the session information of the specified user from the same Firestore collection.

The screenshot shows the Google Cloud Firestore interface. On the left, the sidebar has sections for Database (Data, Indexes, Import/Export, Time-to-live (TTL), Security Rules) and Insights (Usage, Key Visualizer). The main area shows a hierarchical view of collections under 'user-login-stats'. A specific document, '1944b38b-3da9-41dd-901b-15d3b3962d04', is expanded to show its fields: email (value: "agharkar.mugdha@gmail.com"), login_timestamp (value: "July 23, 2022 at 3:07:11 PM UTC-3"), and logout_timestamp (value: "July 23, 2022 at 3:07:18 PM UTC-3").

Collection	Document ID	Field	Value
user-login-stats	1944b38b-3da9-41dd-901b-15d3b3962d04	email	"agharkar.mugdha@gmail.com"
		login_timestamp	"July 23, 2022 at 3:07:11 PM UTC-3"
user-login-stats	306ca97a-af81-4a24-963a-443dcf62965a	logout_timestamp	"July 23, 2022 at 3:07:18 PM UTC-3"

Figure 91: Firestore Collection for storing user login statistics.

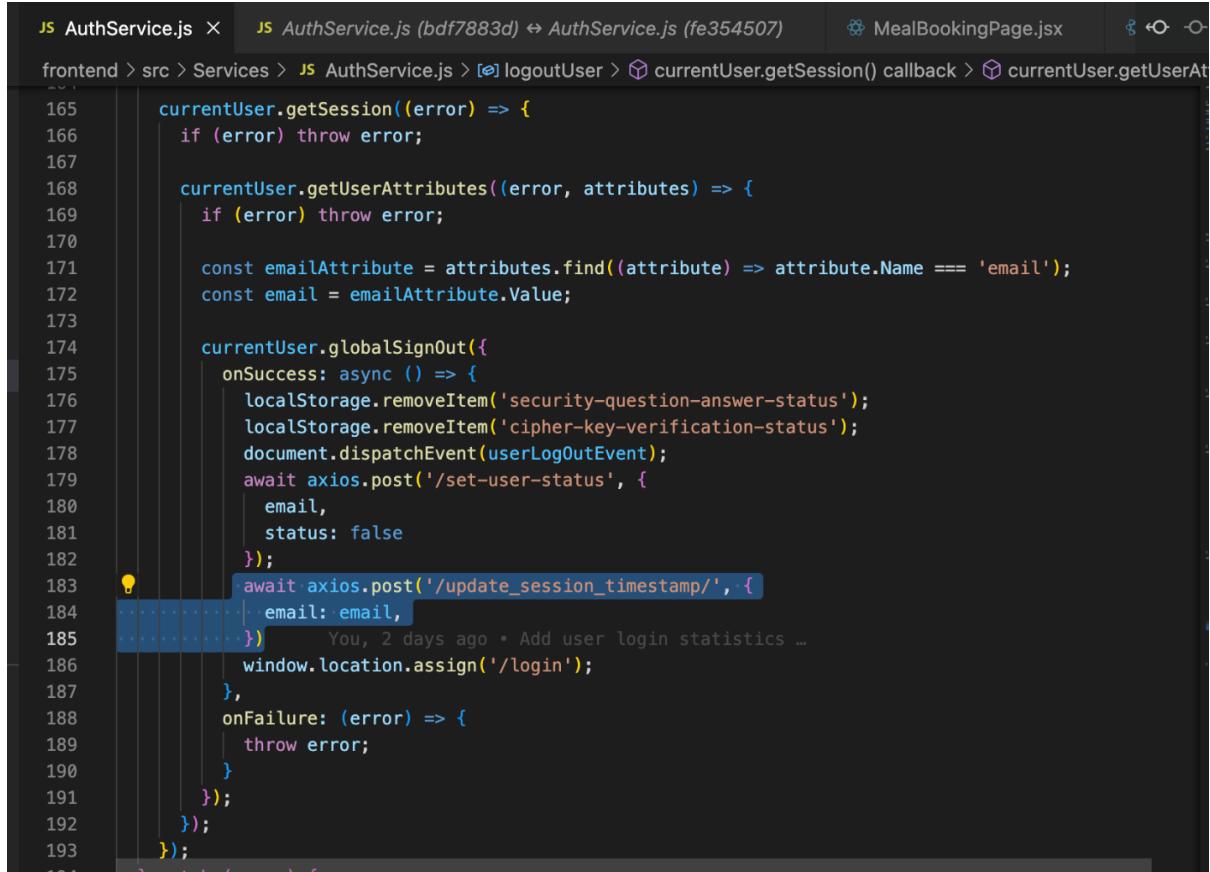

When the user logs in, the *update_session_timestamp* is triggered with the email id of the user. It is a cloud function running behind the API Gateway which takes email id as the input and creates a document for that email id to store the login timestamp. When the user logs out, the log out time stamp is updated in the same document.

```

frontend > src > Pages > CaesarCipherPage.jsx > CaesarCipherPage > handleCaesarCipher
13   const [plainText, setPlainText] = useState('');
14   const [wrongInputError, setWrongInputError] = useState('');

```

Figure 93: API Triggered when user logs out.

The screenshot shows the Google Cloud Platform interface for a Cloud Function named 'update_session_timestamp'. The 'SOURCE' tab is selected, displaying the Python code for main.py. The code reads a JSON request, finds a document in a MongoDB collection based on email, and updates its login timestamp. It also handles creating a new document if none exists.

```

36     request_json = request.get_json()
37     print(request_json)
38     request_args = request.args
39     collection_name = "user-login-stats"
40     login_timestamp = datetime.datetime.now()
41     logout_timestamp = datetime.datetime.now()
42     user_email = request_json["email"]
43     db_doc = db.collection(collection_name).where("email", "==", user_email).get()
44     doc_list = []
45     if db_doc:
46         for d in db_doc:
47             document_dict = d.to_dict()
48             document_dict['id'] = d.id
49             doc_list.append(document_dict)
50     sorted_doc = sorted(doc_list, key=itemgetter("login_timestamp"), reverse=True)
51     logout_not_found = False
52     obj_id = ""
53     for obj in sorted_doc:
54         if "logout_timestamp" not in obj:
55             logout_not_found = True
56             obj_id = obj['id']
57             break

```

Figure 94: update_session_timestamp cloud function.

This screenshot continues the view of the 'update_session_timestamp' function. It shows the continuation of the code where it handles updating or creating a document in the database. The code uses PyMongo's update and insert methods to manage the document based on the user's email and the presence of a logout timestamp.

```

62         db.collection(collection_name).document(obj_id).update(update_req)
63         print(f"Doc updated. Request: {update_req}")
64         return {"message": f"Doc updated. Request: {update_req}", "success": True}, 200, headers
65     else:
66         new_doc = db.collection(collection_name).document(str(uuid4()))
67         set_request = {
68             "email": user_email,
69             "login_timestamp": login_timestamp
70         }
71         new_doc.set(set_request)
72         print(f"New doc created. Request: {set_request}")
73         return {"message": f"New doc created. Request: {set_request}", "success": True}, 200, headers
74     else:
75         new_doc = db.collection(collection_name).document(str(uuid4()))
76         set_request = {
77             "email": user_email,
78             "login_timestamp": login_timestamp
79         }
80         new_doc.set(set_request)
81         print(f"New doc created. Request: {set_request}")
82         return {"message": f"New doc created. Request: {set_request}", "success": False}, 200, headers

```

Figure 95: update_session_timestamp cloud function (continued).

If a logged in user wants to see their previous logged in statistics, they will be able to see the ‘Login Statistics’ link on the header of the webpage. On clicking the link, they will be navigated to the login statistics page. When the component loads for the first time, the `get_user_session_stats` API is called, and the email id of the user is passed in the query params.

```

frontend > src > Pages > LoginStatisticsPage.jsx > [e] LoginStatisticsPage > [e] url
You, 2 days ago | 1 author (You)
1 import React from 'react';
2 import axios from '../Config/AxiosConfig';
3 import { useState, useEffect } from 'react';
4 import { useLocation } from 'react-router-dom';
5
6 const LoginStatisticsPage = (props) => {
7   const [sessionData, setSessionData] = useState([]);
8   const location = useLocation();
9   const userEmail = location.state.userId;
10  const url = "/get_user_session_stats?email=" + userEmail;      You, 2 days ago • Add user login stat
11
12  useEffect(() => {
13    axios.get(url)
14      .then(res => {
15        const data = res.data;
16        setSessionData(data.message);
17      })
18    }, []);
19
20

```

Figure 96: `get_user_session_stats` called to get the login information for the logged in user.

The `get_user_session_stats` cloud function will sort the documents in the `user_session_stats` collection so that the user will be able to check their sessions in the descending order.

```

32
33 user_email = request.args.get("email")
34 print("email: ", user_email)
35 collection_name = "user-login-stats"
36 db_doc = db.collection(collection_name).where("email", "==", user_email).get()
37 doc_list = []
38
39 if db_doc:
40     for d in db_doc:
41         document_dict = d.to_dict()
42         document_dict['id'] = d.id
43         doc_list.append(document_dict)
44
45 print(doc_list)
46 sorted_doc = sorted(doc_list, key=itemgetter("login_timestamp"), reverse=True)
47 return ({'message': sorted_doc, 'success': True}, 200, headers)
48 # else:
49 #     return ('', 204, headers)
50 except Exception as e:
51     return ({'message': e, 'success': False}, 500, headers)

```

Figure 97: `get_user_session_stats` cloud function.

Following is the example of the logged in user '`agharkar.mugdha@gmail.com`'. Their previous 9 login sessions are visible with the login and logout timestamp.

The screenshot shows a web browser window with the URL main.d1gwq7lhjz8oz9.amplifyapp.com/login-statistics. The page title is "Login Statistics". The header includes the logo "Serverless B&B", navigation links for "Rooms", "Meals", "Tours", "Feedback", and "Visualizations", and a user account section with the email "agharkar.mugdha@gmail.com", "Login Statistics", and "Log Out". Below the header is a table with two columns: "Session #" and "Logged-in". The table lists 9 sessions, each with a timestamp. To the right of the table is another column labeled "Logged-out" with corresponding timestamps.

Session #	Logged-in	Logged-out
0	Sun, 24 Jul 2022 18:32:57 GMT	Mon, 25 Jul 2022 15:39:45 GMT

Figure 98: The logged in user can see their previous logged in sessions.

Visualizations:

For the visualization module, we have considered analysis for three as described below. We have used BigQuery for running the queries on our data and used Google Data Studio [10] to visualize the data.

1. Popular tours among the available tours – Adventure, Wildlife, Nature

The *tours* collection in Firestore contains information about the different types of tours available. The *tour_booking* collection contains the booking information of all the tours. These two collections are exported from Firestore and imported into the *Serverlessbnb_visualizations* collection in BigQuery.

The screenshot shows the Google Cloud Firestore interface with the 'Data' tab selected. The left sidebar includes sections for Database (Indexes, Import/Export, Time-to-live (TTL), Security Rules), Insights (Usage, Key Visualizer), and Release Notes. The main area displays the 'tours' collection under the Root. A document named '1' is selected, showing fields: tour_id: 1, tour_price: 79, and tour_type: "Adventure". Other documents in the collection include '2' and '3'. A modal window for document '1' is open, showing the same three fields.

Figure 99: tours collection.

The screenshot shows the Google Cloud Firestore interface with the 'Data' tab selected. The left sidebar includes sections for Database (Indexes, Import/Export, Time-to-live (TTL), Security Rules), Insights (Usage, Key Visualizer), and Release Notes. The main area displays the 'tour_booking' collection under the 'tour' collection. A specific document is selected, showing fields: customer_id: "agharkar.mugdha@gmail.com", date: "2022-07-23", status: "Delivered", tour_id: 2, and tour_qty: 1. The document ID is 0Z5XpyXnrGip1a2QWTNo.

Figure 100: tour_booking collection.

The screenshot shows the Google Cloud Firestore Import/Export dashboard. On the left, there's a sidebar with options like Database, Data, Indexes, Import/Export (which is selected), Time-to-live (TTL), Security Rules, Insights, Usage, and Key Visualizer. Below the sidebar, a section titled "Recent imports and exports" displays a table of operations. The table has columns for Started (sorted by time), Type, Collection groups, Bucket, Documents, Size, and Completed. The data shows several exports from July 18-21, 2022, to buckets like "serverless_visualization_an..." and "serverless_visualization_an...".

Started	Type	Collection groups	Bucket	Documents	Size	Completed
Jul 21, 2022, 2:43:03 AM	Export	meals	serverless_visualization_an...	2	232 B	Jul 21, 2022, 2:43:17 AM
Jul 21, 2022, 2:35:33 AM	Export	meal_booking	serverless_visualization_an...	13	2.62 KB	Jul 21, 2022, 2:36:43 AM

Figure 101: All exported collections from firestore

The *tours* and *tour_booking* collections are imported in a temporary folder in BigQuery, where a join query was performed to calculate the count of type of meals opted by the customers so far. There is an option in a dashboard to visualize the data with Google Data Studio as seen in the following figure.

The screenshot shows the Google BigQuery interface. The left sidebar includes Analysis, SQL workspace, Data transfers, Scheduled queries, Analytics Hub, Migration, SQL translation, Administration, Monitoring, Capacity management, and BI Engine. The main area shows a query editor with a SQL query and a results table. The query joins two tables to count tours by type. The results table shows two rows: Adventure with 19 tours and Wildlife with 24 tours.

```

1 select t2.tour_type, count(t1.tour_id) from serverlessbnb-354422.visualization_serverless_bnb.tour_booking_analytics as t1 inner join serverlessbnb-354422.visualization_serverless_bnb.tours as t2 on t1.tour_id=t2.tour_id group by t2.tour_type;

```

tour_type	count(tour_id)
Adventure	19
Wildlife	24

Figure 102: popular tours query in bigQuery.

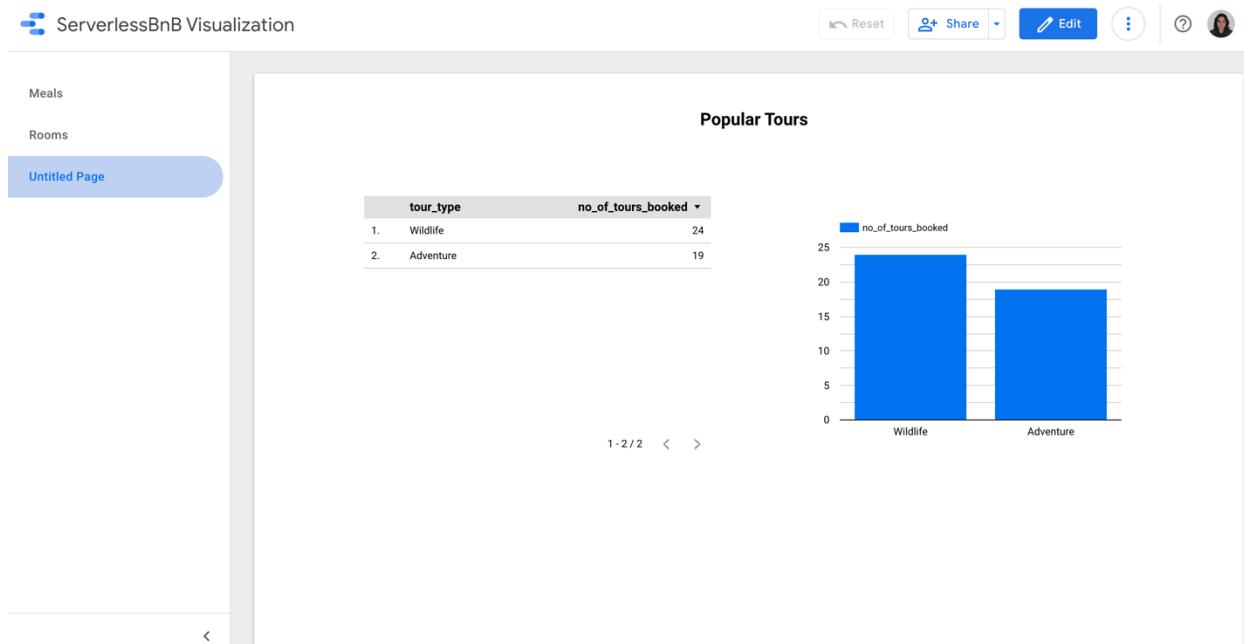

Figure 103: Popular Tours visualization.

2. Popular meals among the available meals – Veg and Non-Veg

The *meals* collection in Firestore contains information about the different types of tours available. The *meal_booking* collection contains the booking information of all the tours. These two collections are exported from Firestore and imported into the *Serverlessbnb_visualizations* collection in BigQuery.

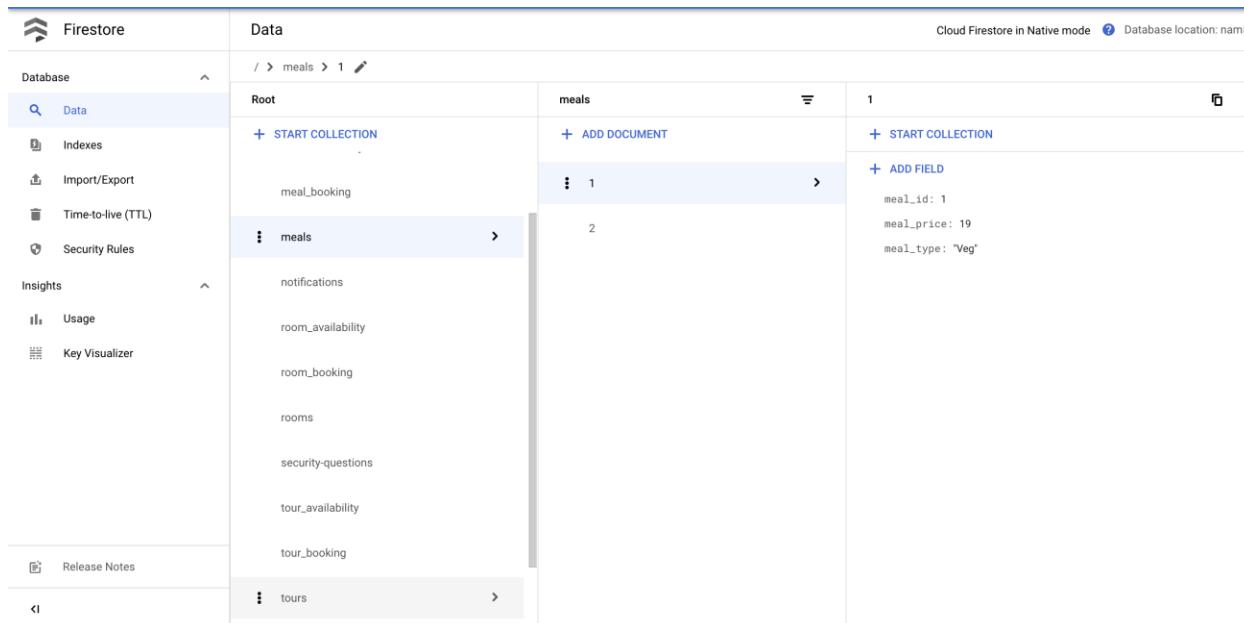

Figure 104: meals collection.

The screenshot shows the Google Cloud Firestore interface. The left sidebar has sections for Database (Data, Indexes, Import/Export, Time-to-live (TTL), Security Rules), Insights (Usage, Key Visualizer), and Release Notes. The main area shows a collection named 'meals' under the 'Root' path. A single document named '1' is listed under 'meals'. The document details are: meal_id: 1, meal_price: 19, meal_type: "Veg". Below the 'meals' collection, other collections like 'caesar_keys', 'meal_availability', 'meal_booking', 'notifications', 'room_availability', 'room_booking', 'rooms', 'security-questions', and 'tour_availability' are visible.

Figure 105: meal_booking collection.

The *meals* and *meal_booking* collections are imported in a temporary folder in BigQuery, where a join query was performed to calculate the count of type of meals opted by the customers so far. There is an option in a dashboard to visualize the data with Google Data Studio as seen in the following figure.

The screenshot shows the Google Cloud BigQuery interface. The left sidebar includes sections for Analysis, SQL workspace, Data transfers, Scheduled queries, Analytics Hub, Migration, SQL translation, Administration, Monitoring, Capacity management, BI Engine, and Release Notes. The main area displays an 'Explorer' view for the 'mealBooking' dataset. A search bar at the top right is set to 'mealBooking'. Below it, a query editor window contains the following SQL code:

```
1 SELECT meal_type, count(meal_type) FROM `serverlessbnb-354422.visualization_serverless_bnb.meals` as meals
INNER JOIN `serverlessbnb-354422.visualization_serverless_bnb.meal_booking` as meal_booking ON meals.meal_id = meal_booking.meal_id GROUP BY meals.meal_type
```

The results pane shows the following data:

meal_type	Count
Veg	8
Non-Veg	3

Below the results, there are options to 'SAVE RESULTS' or 'EXPLORE DATA'. A tooltip indicates that this query will process 118 B when run.

Figure 106: popular meals query in bigquery.

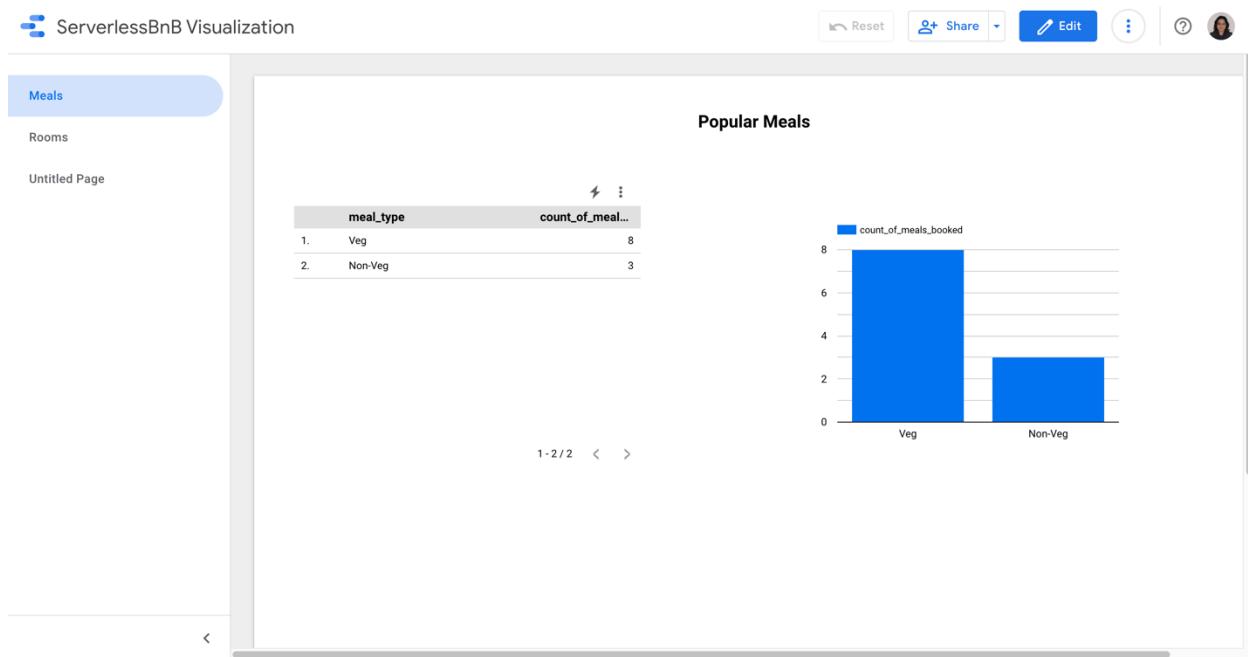

Figure 107: Popular meals visualization.

3. Popular rooms among the room types – AC, Non-AC, Deluxe, Suite

The *rooms* collection in Firestore contains information about the different types of tours available. The *room_booking* collection contains the booking information of all the tours. These two collections are exported from Firestore and imported into the *Serverlessbnb_visualizations* collection in BigQuery.

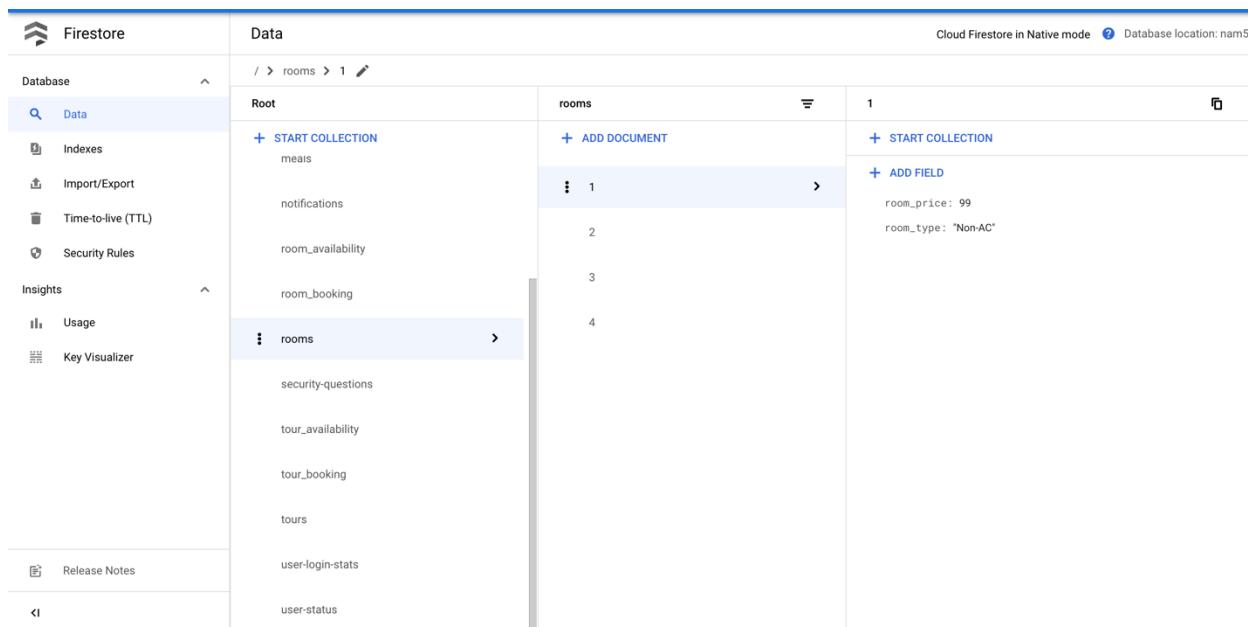

Figure 108: rooms collection

The screenshot shows the Google Cloud Firestore interface. On the left, the sidebar includes sections for Database (Indexes, Import/Export, Time-to-live (TTL), Security Rules), Insights (Usage, Key Visualizer), and Release Notes. The main area displays the structure of the 'room_booking' collection under the 'room_booking' document. The collection contains documents for various users: agharkar.mugdha@gmail.com, jay.hello@dal.ca, jay.patel@dal.ca, jay.sonani@dal.ca, mg425404@dal.ca, pankti.vyas21@gmail.com, rahulkherajani20@gmail.com, rh346685@dal.ca, and ruchi.shinde97@gmail.com. Each user document contains fields for checkin_date ('07-24-2022'), checkout_date ('07-26-2022'), and rooms_qty (1).

Figure 109: room_booking collection

The *rooms* and *room_booking* collections are imported in a temporary folder in BigQuery, where a join query was performed to calculate the count of type of meals opted by the customers so far. There is an option in a dashboard to visualize the data with Google Data Studio as seen in the following figure.

The screenshot shows the Google BigQuery interface. The sidebar includes Analysis (SQL workspace, Data transfers, Scheduled queries, Analytics Hub), Migration (SQL translation), Administration (Monitoring, Capacity management, BI Engine), and Release Notes. The main area shows a query titled 'room_booking' with the following SQL code:

```
1 SELECT count(NonAC) as NonAC, count(AC) as AC, count(Suite) as Suite, count(Deluxe) as Deluxe FROM `serverlessbnb-354422.visualization_serverless_bnb.room_booking`;
```

The results table shows the count of room types:

	NonAC	AC	Suite	Deluxe
Row	1	1	4	2

Below the results, there are options to 'Explore with Sheets' (Analyze big data with a live connection in a familiar spreadsheet tool) and 'Explore with Data Studio' (Visualize results and create live dashboards from your data).

Figure 110: popular room types query in BigQuery

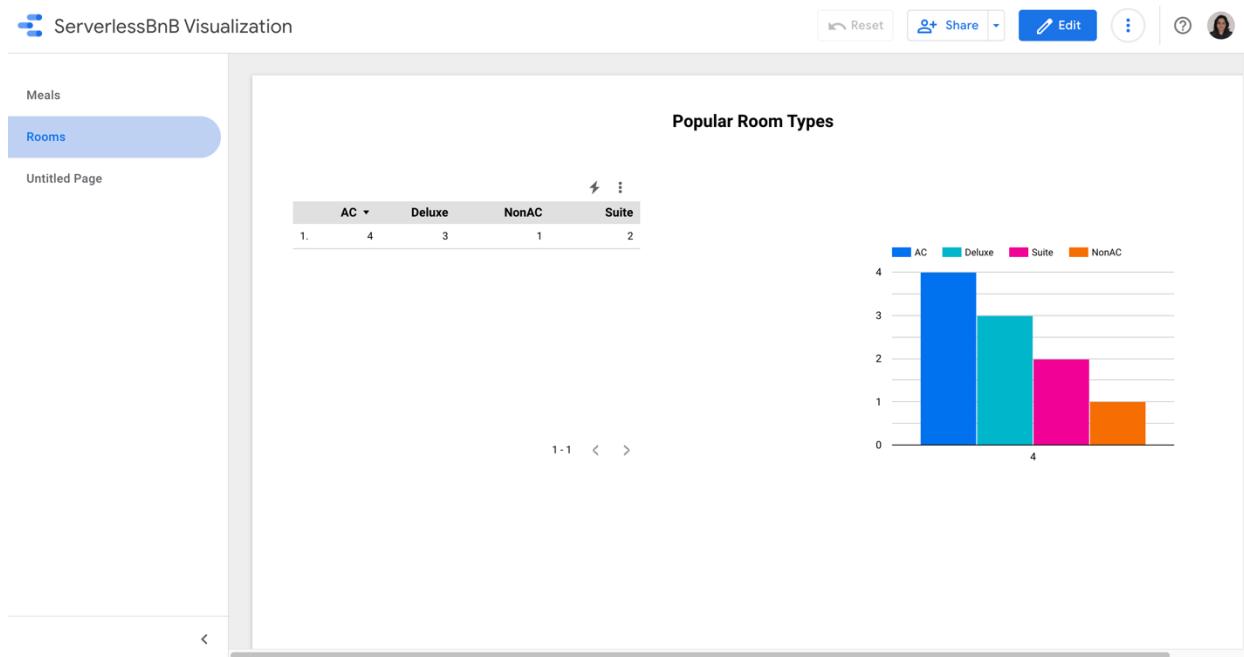

Figure 111: Popular room types visualization.

All these visualizations were stored in one report, where we get an option to embed the report in a webpage. This link was copied and added in an iframe on the front-end, so that it could be rendered directly in a component on the Visualizations page.

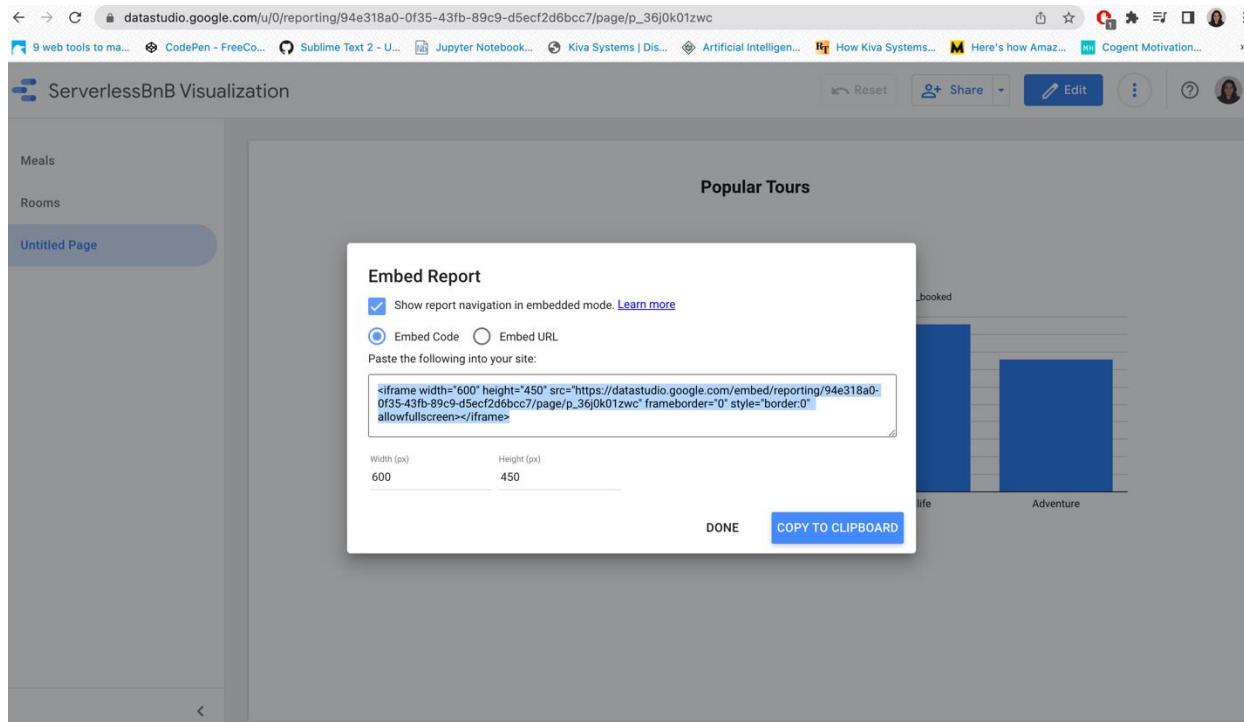

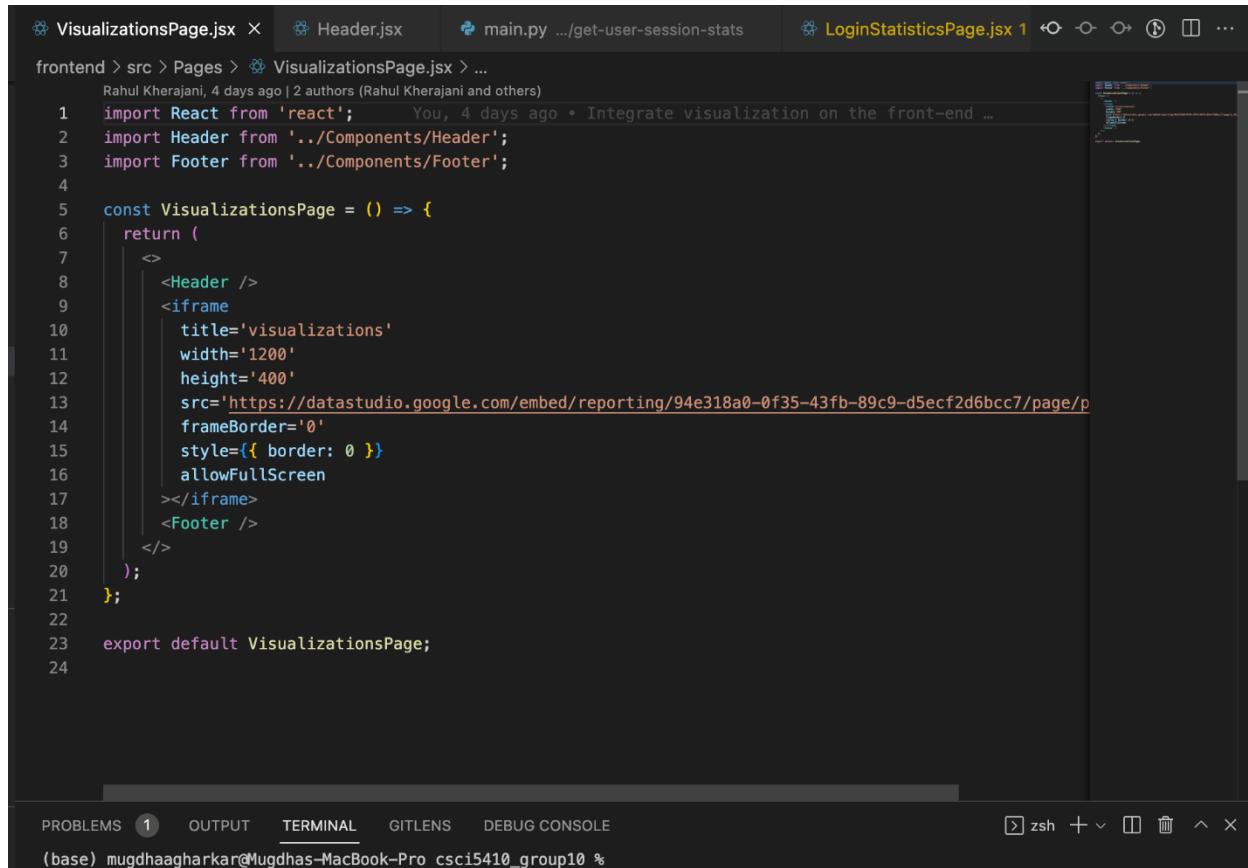

Figure 112: Embedding the report.

The screenshot shows a code editor interface with several tabs at the top: "VisualizationsPage.jsx", "Header.jsx", "main.py", and "LoginStatisticsPage.jsx 1". The "VisualizationsPage.jsx" tab is active, displaying the following code:

```

frontend > src > Pages > VisualizationsPage.jsx > ...
Rahul Kherajani, 4 days ago | 2 authors (Rahul Kherajani and others)
1 import React from 'react'; You, 4 days ago • Integrate visualization on the front-end ...
2 import Header from '../Components/Header';
3 import Footer from '../Components/Footer';
4
5 const VisualizationsPage = () => {
6   return (
7     <>
8       <Header />
9       <iframe
10         title='visualizations'
11         width='1200'
12         height='400'
13         src='https://datastudio.google.com/embed/reporting/94e318a0-0f35-43fb-89c9-d5ecf2d6bcc7/page/p
14         frameBorder='0'
15         style={{ border: 0 }}
16         allowFullScreen
17       ></iframe>
18       <Footer />
19     </>
20   );
21 }
22
23 export default VisualizationsPage;
24

```

Below the code editor is a terminal window showing the command: "(base) mugdhaagharkar@Mugdhas-MacBook-Pro csci5410_group10 %". The bottom navigation bar includes links for PROBLEMS, OUTPUT, TERMINAL, GITLENS, DEBUG CONSOLE, and a zsh shell.

6. Individual and Team contribution

Table 3: Team Contribution per module.

Module name	Team member
User Management Module	Pankti Vyas
User Authentication Module	Pankti Vyas (Login, Security Question Authentication, Logout, Session Management) Jay Sonani (Caesar-Cipher Authentication)
Online Virtual Assistance Module	Vivekkumar Patel
Message Passing Module	Rahul Kherajani
Machine Learning Module	Ridham Kathiriya
Web Application building and hosting	Frontend Development (Everyone) Frontend Deployment (Rahul Kherajani)
Visualization and Report Generation	Mugdha Agharkar
Services	Jay Sonani, Mugdha Agharkar (Room Booking) Rahul Kherajani (Tour booking, meal booking)
Reports and Documentations	Everyone
Demo video	Module-wise demo: Everyone Overall demo: Mugdha Agharkar Architectrue : Rahul Kherajani

7. Limitations

As of now our ML models cannot be trained continuously because it is too costly. Sentiment analysis model requires 21\$ per train and package predictor requires 23\$ credits per train.

Also, API gateway configured for our application is open which means, the requests received by gateway are not authenticated for the users signed up on AWS Cognito. This was particularly challenging since GCP API gateway can be secured using GCP IAM users but configuring it with AWS Cognito lies in future scope for our project.

8. Meeting logs

8.1 Introductory meeting

Date: 19th May 2022

Total Time: 25 Minutes

Mode: Online (Teams)

Agenda: Get to know each other's strengths and have an overview of project requirements.

Outcome: We learned about everyone's strengths and familiarized ourselves with all the required features.

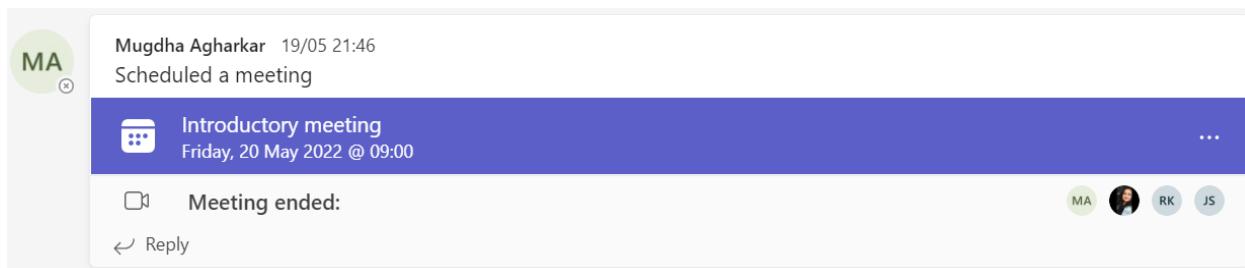

Figure 119: Meeting 1.

8.2 Finalize Tech stack

Date: 23rd May 2022

Total Time: 35 Minutes

Mode: Online (Teams)

Agenda: To decide project Tech stack

Outcome: We have decided to go with MERN stack.

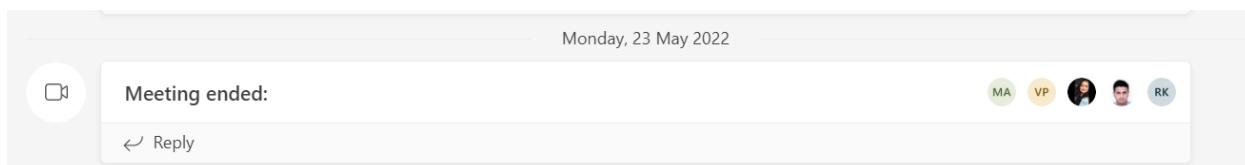

Figure 120: Meeting 2.

8.3 Feature distribution

Date: 30th May 2022

Total Time: 2 hours 30 Minutes

Mode: In person

Agenda: To divide design and development modules among group members

Outcome: Modules are equally distributed (Pankti: Module-1, Jay: Module-2, Vivek: Module-3, Rahul: Module-4, Ridham: Module-5, Mugdha: Module-7). Everyone will work on Module-6 and Module-8.

8.4 Conceptual report design

Date: 2nd Jun 2022

Total Time: 4 hours

Mode: In person (W.K Kellogg Health Sciences Library)

Agenda: To prepare the first deliverable of our application

Outcome: Prepared and delivered the best project conception report.

8.5 Scrum Cycle 1

Date: 10th Jun 2022

Total Time: 2 hours

Mode: In person (W.K Kellogg Health Sciences Library)

Agenda: To verify the progress and doubt solving

Outcome: Each member received more clarification on individual modules.

8.6 Scrum Cycle 2

Date: 17th Jun 2022

Total Time: 2 hours

Mode: In person (W.K Kellogg Health Sciences Library)

Agenda: To decide the actual flow of application (How modules will interact with each other)

Outcome: We came up with the basic application flow chart.

8.7 Scrum Cycle 3

Date: 23rd Jun 2022

Total Time: 1 hours 22 minutes

Mode: Online

Agenda: To verify the progress and doubt solving

Outcome: Each member received more clarification on module interactions.

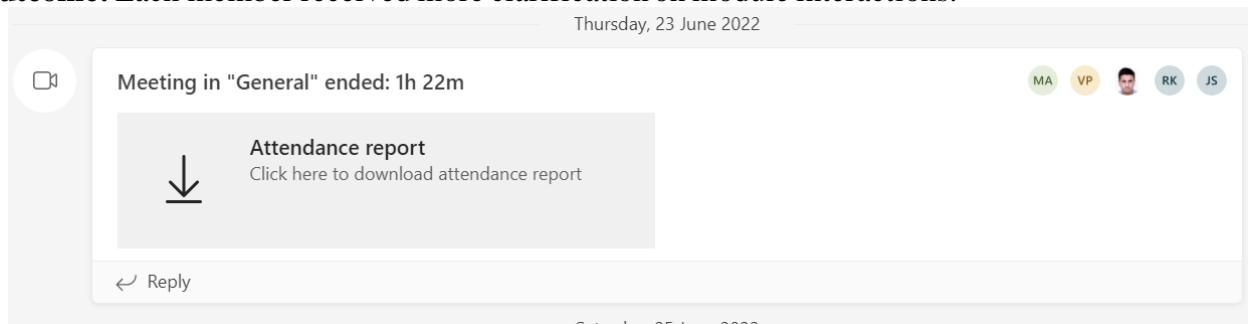

Figure 121: Scrum Cycle 3.

8.8 Project Design Document

Date: 4th July 2022

Total Time: 18 minutes

Mode: Online

Agenda: To prepare our second deliverable “The project design document”

Outcome: We divide the work among team members to complete the document.

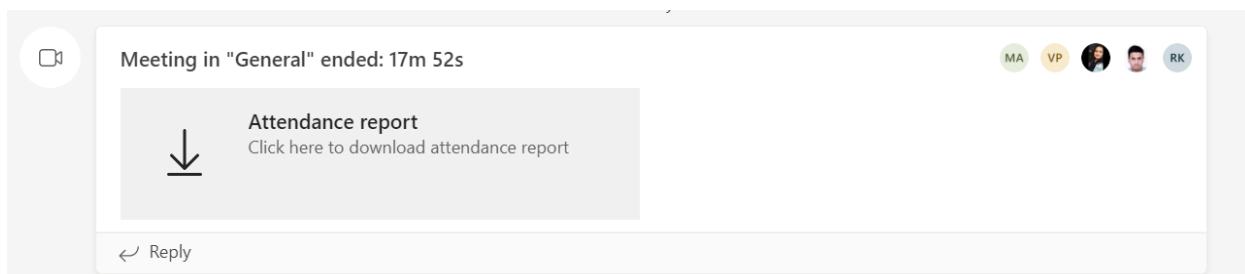

Figure 122: Project design meeting.

8.9 Scrum Cycle 4

Date: 10th July 2022

Total Time: 2 hours 22 minutes

Mode: In person (Kellogg Library)

Agenda: To verify the progress and doubt solving

Outcome: Each member received more clarification on module interactions and integration.

8.10 Scrum Cycle 4

Date: 16th July 2022

Total Time: 2 hours

Mode: In person (Kellogg Library)

Agenda: To complete the project

Outcome: Completed modules integrated successfully.

8.11 Project Demo

Date: 21st July 2022

Total Time: 30 minutes

Mode: Online (with professor)

Agenda: To answer the project specific questions

Outcome: provided satisfactory answers to the professor.

Figure 123: On a meeting with the professor.
